

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

THE
L I F E
O F T H E
A U T H O R.

SIR *William Petty*, the ingenious Author of the following judicious Tracts, was Son of *Anthony Petty*, a Clothier at *Rumsey* in *Hampshire*, and born *May 26, 1623*. He took great Delight, whilst a Boy, in spending his Time among Carpenters, Smiths, and other Artificers, whose Trades he so well understood, that at 12 Years of Age he could work at them. His Education was only at the Grammar School there, but he made so great a Progress
A in

ii LIFE of the AUTHOR.

in his Learning, that when he was 15, he had made himself Master of *Latin, Greek, and French*, understood *Dialling*, and so much of *Geometry* and *Astronomy*, as was useful to Navigation.

Soon after he went to *Caen* in *Normandy*, with a little Stock of Merchandize, which he there improved : From thence to *Paris*, where he studied *Anatomy*, and came there acquainted with Mr. *Hobbes*, who had a great Affection for him, and assisted him in his Studies. Upon his Return to *England* he had a Place given him in the Royal Navy.

In 1643, when the War grew hot between the King and Parliament, he went into the *Netherlands* and *France*, prosecuting his Studies for 3 Years, and then returned to *Rumsey*, with so small a Stock as only about 70*l.* in Cash, but with an inexhaustible Treasure of useful Learning.

In 1647, he obtained a Patent from the Parliament for 17 Years to teach the *Art of double Writing*. He sided with the Parliament in Opinion, and in 1648 went to *Oxford*, where he became Deputy to Dr. *Tho. Clayton*, Professor of Anatomy, and under him instructed young Students in that Science, and in Chemistry.

LIFE of the AUTHOR. iii

In *March* 1649, he was created Doctor of Physick, and soon after made Fellow of *Brazen Nose* College. In *December* 1650, he was one of the Persons concerned in recovering *Anne Green* to Life, who was hanged at *Oxford* on the 14th for the supposed Murther of her Bastard Child. *January* following he was elected Professor of Anatomy in the Room of *Dr. Clayton* who resigned, and soon after was made a Member of the College of Physicians, and Music-Professor at *Gresham* College.

Being now Master of 500*l.* he went to *Ireland*, where he was made Physician to the Army by the Parliament, with an Allowance of 20 *s. per Diem*, in which Post he continued till *June* 1659, gaining by his Practice 4000*l. per Annum*, beside his Salary.

In 1654, perceiving that the Lands which were forfeited in 1641, and given to the Soldiers for suppressing the Rebellion; then in *Ireland* were very falsly measured, and therefore un-equally divided by the Unskillfulness of the Surveyors, he entered into a Contract in *December* 1654 to regulate the Admeasurements, by which he gained 9000*l.* He was then made Clerk of the Council for two Years, with a Salary of 400*l. per Annum*. By these Advantages, and his considerable Practice in Physick, he had now increased his Fortune so much as to be worth full 13 Thousand Pounds; Part of

this Money he improved by purchasing Soldiers Debentures, and with Part he bought the Earl of *Arundel's* House in *Lotb bury*, *London*. The rest he kept in Cash for any improveable Emergency.

January 1658, he was elected a Burgess for *Westlow* in *Cornwall*, in the Parliament called by *Richard Cromwell*; but that being soon dissolved, he returned to *Ireland*, where he had a great Contest with *Sir Jerom Sankey*, who charged him with amassing a great Fortune by taking great Bribes, buying Debentures against the Statute, by fraudulently procuring several Lands, having used foul Practices in setting out the Lands, and other Misdemeanors; against which Charges *Mr. Petty* vindicated himself in a small Tract, but it doth not appear that he received any publick Censure.

After the Restoration he returned to *England*, and was introduced to King *Charles II.* who was so highly pleased with his Ingenuity, that *April* 11, 1661, he knighted him, and, as it was reported, designed to create him Earl of *Kilmore* in *Ireland*. Upon the Establishment of the Royal Society, he was one of the first Members, and afterwards one of its Council.

In 1663, *Sir William Petty* was greatly applauded in *Ireland* for the Success of his new Invention of a double-bottomed Ship; she failed

LIFE of the AUTHOR. v

failed from *Dublin* in *July* 1663, and turned into the narrow Harbour of *Holyhead*, amongst the Rocks and Ships, with such Dexterity, that many experienced Seamen did confesse they had never seen the like. It appeared very much to excell all other Forms of Ships in Sailing, in Carriage, in Security, and many other Benefits. Sir *William* gave a Model of this Ship, made with his own Hand, to the Royal Society, and it is now in their Musæum; and, as Bishop *Sprat* observes, this Invention will undoubtedly produce great Effects, if ever it shall be brought to Perfection, upon the publick Stock of the Nation.

He died at his House in *Picadilly* the 16th. of *December* 1687, of a Gangrene in the Foot, occasioned by the Gout, in his 63d Year, and was buried at his native Town *Rumsey*. By his Wife *Elizabeth*, Daughter of Sir *Hardres Waller*, Knight, and Relict of Sir *Maurice Fenton*, he had Issue *Charles*, *Henry*, and one Daughter *Anne*. *Charles* the eldest Son was soon after his Father's Death created Baron of *Sbelburn* in *Ireland*.

By his last Will it appears that he estimated his real Estate at 6500 *l. per Annum*, his personal Estate about 45000 *l.* and the demonstrable Improvements of his *Irish* Estates at 4000 *l. per Annum*; In all he may be reckoned to have left behind him to the Amount of 15000 *l. per*

vi LIFE of the AUTHOR.

Annum. A prodigious Fortune to raise from so small a Beginning.

He wrote several small Treatises, chiefly mathematical, some of which are inserted in the *Philosophical Transactions*. A Catalogue of them is annexed to his Life in the *General Dictionary*, Vol. 8. Article PETTY. But the most esteemed, and indeed most useful, are those which are here collected, and have already gone through three Editions ; but being become very scarce, and much sought after, it was thought that a new Edition would be acceptable to the Publick, which is printed from the most correct and compleat Editions of his several Tracts.

POLITICAL ARITHMETICK,

Concerning the Growth of the

CITY OF LONDON:

WITH THE

Measures, Periods, Causes, and Consequences thereof, 1682.

The Second Edition, revised and enlarged.

By Sir WILLIAM PETTY, Fellow of the
Royal Society.

THE
 S T A T I O N E R
 TO THE
 R E A D E R.

THE ensuing Essay concerning the Growth of the City of *London*, was intituled [*Another Essay*] intimating that some other Essay had preceded it, which was not to be found. I having been much importuned for that precedent Essay, have found that the same was about the Growth, Encrease, and Multiplication of Mankind, which Subject should in Order of Nature precede that of the Growth of the City of *London*, but am not able to procure the Essay itself, only I have obtained from a Gentleman, who sometimes corresponded with Sir *William Petty*, an Extract of a Letter from Sir *William* to him, which I verily believe containeth the Scope thereof; wherefore, I must desire the Reader to be content therewith, till more can be had.

The

*The Extract of a Letter concerning the Scope of
an Essay intended to precede another Essay con-
cerning the Growth of the City of London, &c.
An Essay in Political Arithmetick, concerning
the Value and Encrease of People and Colonies.*

THE Scope of this Essay, is concerning People and Colonies, and to make way for another Essay concerning the Growth of the City of *London*. I desire in this first Essay to give the World some Light, concerning the Numbers of People in *England*, with *Wales*, and in *Ireland*; as also, of the Number of Houses, and Families, wherein they live, and of Acres they occupy.

2. How many live upon their Lands, how many upon their Personal Estates, and Commerce, and how many upon Art and Labour; how many upon Alms, how many upon Offices and Publick Employments, and how many as Cheats and Thieves; how many are Impotents, Children, and decrepit old Men.

3. How many upon the Poll-Taxes in *England*, do pay extraordinary Rates, and how many at the Level.

4. How many Men and Women are prolific, and how many of each are married or unmarried.

5. What the Value of People are in *England*, and what in *Ireland*, at a Medium, both as
Members

Members of the Church or Commonwealth, or as Slaves and Servants to one another; with a Method how to estimate the same, in any other Country or Colony.

6. How to compute the Value of Land in Colonies, in Comparison to *England* and *Ireland*.

7. How 10000 People in a Colony may be, and planted to the best Advantage.

8. A Conjecture in what Number of Years *England* and *Ireland* may be fully peopled, as also all *America*, and lastly the whole habitable Earth.

9. What Spot of the Earth's Globe were fittest for a general and universal Emporium, whereby all the People thereof may best enjoy one anothers Labours and Commodities.

10. Whether the speedy Peopling of the Earth would make

First, For the Good of Mankind.

Secondly, To fulfil the revealed Will of God.

Thirdly, To what Prince or State the same would be most advantageous.

11. An Exhortation to all thinking Men to save the Scriptures, and other good Histories, concerning the Number of People in all Ages of the World, in the great Cities thereof, and elsewhere.

12. An Appendix concerning the different Number of Sea-fish and Wild-fowl, at the End of every thousand Years, since *Noah's* Flood.

13. An Hypothesis of the Use of those Spaces (of about 8000 Miles through) within the
Globe

Globe of our Earth, supposing a Shell of 150 Miles thick.

14. What may be the Meaning of glorified Bodies, in case the Place of the Blessed shall be without the Convex of the Orb of the fixed Stars, if that the whole System of the World was made for the Use of our Earth's-men.

The principal Points of this Discourse.

1. **T**HAT *London* doubles in Forty Years, and all *England* in Three Hundred and sixty Years.

2. That there be, *Anno 1682.* about six Hundred and seventy Thousand Souls in *London*, and about seven Millions four hundred Thousand in all *England* and *Wales*, and about twenty-eight Millions of Acres of profitable Land.

3. That the Periods of doubling the People, are found to be in all Degrees, from between Ten, to Twelve hundred Years.

4. That the Growth of *London* must stop of itself, before the Year 1800.

5. A Table helping to understand the Scriptures, concerning the Number of People mentioned in them.

6. That the World will be fully peopled within the next two Thousand Years.

7. Twelve Ways whereby to try any Proposal, pretended for the Publick Good.

8. How

8. How the City of *London* may be made (morally speaking) invincible.

9. An Help to Uniformity in Religion.

10. That it is possible to encrease Mankind by Generation four Times more than at present.

11. The Plagues of *London* are the chief Impediment and Objection, against the Growth of the City.

12. That an exact Account of the People is necessary in this Matter.

*Of the Growth of the City of London: Aiid of
the Measures, Periods, Causes, and Consequences
thereof.*

BY the City of *London*, we mean the Houses within the Walls of the old City, with the Liberties thereof, *Westminster*, the Borough of *Southwark*, and so much of the built Ground in *Middlesex* and *Surrey*, whose Houses are contiguous unto, or within Call of those afore-mentioned. Or else we mean the Houses which stand upon the Ninety seven Parishes within the Walls of *London*; upon the Sixteen Parishes next, without them; the Six Parishes of *Westminster*, and the Fourteen out-Parishes in *Middlesex* and *Surrey*, contiguous to the former; all which One hundred and thirty three Parishes are comprehended within the Weekly Bills of Mortality.

The Growth of this City is measured; 1. By the Quantity of Ground, or Number of Acres upon which it stands. 2. By the Number of Houses, as the same appears by the Hearth-books and late Maps. 3. By the Cubical Content of the said Houses. 4. By the Flooring of the same. 5. By the Number of Days-work, or Charge of building the said Houses. 6. By the Value of the said Houses, according to their yearly Rent, and Number of Years Purchase. 7. By the Number of Inhabitants; according to which latter

latter Sense only, we make our Computations in this Essay.

Till a better Rule can be obtained, we conceive that the Proportion of the People may be sufficiently measured by the Proportion of the Burials in such Years as were neither remarkable for extraordinary Healthfulness or Sickliness.

That the City hath increased in this latter Sense, appears from the Bills of Mortality, represented in the two following Tables, *viz.* One whereof is a Continuation for Eighteen Years, ending in 1682. of that Table which was published in the 117th Page of the Book of the *Observations upon the London Bills of Mortality*, printed in the Year 1676. The other sheweth what Number of People dyed at a Medium of two Years, indifferently taken, at about Twenty Years Distance from each other.

The first of the said two Tables.

An.Dom.	97 Parishes.	16 Parishes.	Out- Parishes.	Buried in all.	Besides of the Plague.	Christen'd.
1665	5320	12463	10925	28708	68596	9967
1666	1689	3969	5082	10740	1998	8997
1667	761	6405	8641	15807	35	10938
1668	796	6865	9603	17267	14	11633
1669	1323	7500	10440	19263	3	12335
1670	1890	7808	10500	20198		11997
1671	1723	5938	8063	15724	5	12510
1672	2237	6788	9200	18225	5	12593
1673	2307	6302	8890	17499	5	11895
1674	2801	7522	10875	21198	3	11851
1675	2555	5986	8702	17243	1	11775
1676	2756	6508	9466	18730	2	12399
1677	2817	6632	9616	19065	2	12626
1678	3060	6705	10908	20673	5	12601
1679	3074	7481	11173	21728	2	12288
1680	3076	7066	10911	21053		12747
1681	3669	8136	12166	23971		13355
1682	2975	7009	10707	20691		12653

According to which latter Table, there died as followeth.

The latter of the said two Tables.

There died in *London*, at a Medium between the Years.

1604 and 1605 ——— 5135. A.

1621 and 1622 ——— 8527. B.

1641 and 1642 ——— 11883. C.

1661 and 1662 ——— 15148. D.

1681 and 1682 ——— 22331. E.

B

Wherein

Wherein observe, That the Number C. is double to A. and 806 over. That D. is double to B. within 1906. That C. and D. is double to A. B. within 293. That E. is double to C. within 1435. That D. and E. is double to B. and C. within 3341. And that C. and D. and E. are double to A. and B. and C. within 1736. And that E. is above Quadruple to A. All which Differences (every way considered) do allow the doubling of the People of *London* in forty Years, to be a sufficient Estimate thereof in round Numbers, and without the Trouble of Fractions. We also say, That 669930 is near the Number of People now in *London*, because the Burials are 22331. which multiplied by 30, (one dying yearly out of 30, as appears in the 94th Page of the aforementioned Observations) maketh the said Number; and because there are 84 Thousand tenanted Houses (as we are credibly informed) which at 8 in each, makes 672 Thousand Souls; the said two Accounts differing inconsiderably from each other.

We have thus pretty well found out in what Number of Years (*viz.* in about 40.) that the City of *London* hath doubled, and the present Number of Inhabitants to be about 670 Thousand. We must now also endeavour the same for the whole Territory of *England* and *Wales*. In Order whereunto, we

First say, That the Assessment of *London* is about an eleventh Part of the whole Territory, and therefore that the People of the whole
may

may well be eleven Times that of *London*, viz. about 7 Millions, 369 Thousand Souls; with which Account that of the Poll-Money, Hearth-Money, and the Bishops late Numbering of the Communicants, do pretty well agree; wherefore although the said Number of 7 Millions, 369 Thousand, be not (as it cannot be) a demonstrated Truth, yet it will serve for a good Supposition, which is as much as we want at present.

As for the Time in which the People double, it is yet more hard to be found: For we have good Experience (in the said 94th Page of the afore-mentioned Observations) That in the Country, but one of Fifty die *per Annum*; and by other late Accounts, that there have been sometimes but 24 Births for 23 Burials: The which two Points, if they were universally, and constantly true, there would be Colour enough to say, that the People doubled but in about 1200 Years. As for Example: Suppose there be 600 People, of which let a fiftieth Part die *per Annum*, then there shall die 12 *per Annum*; and if the Births be as 24 to 23, then the Increase of the People shall be somewhat above half a Man *per Annum*, and consequently the supposed Number of 600; cannot be doubled but in 1126 Years, which to reckon in round Numbers, and for that the afore-mentioned Fractions were not exact, we had rather call 1200.

There are also other good Observations, That even in the Country, one in about 30, or 32 *per Annum*, hath died, and that there have been five Births for four Burials. Now, according to this Doctrine, 20 will die *per Annum* out of the above 600, and 25 will be born, so as the Increase will be 5, which is a hundred and twentieth Part of the said 600. So as we have two fair Computations, differing from each other as one to ten; and there are also several other good Observations for other Measures.

I might here insert, That although the Births in this last Computation be 25 of 600, or a Twenty-fourth Part of the People; yet that in natural Possibility, they may be near thrice as many, and near 75. For that by some late Observations, the teeming Females between 15 and 44, are about 180 of the said 600, and the Males of between 18 and 59, are about 180 also, and that every teeming Woman can bear a Child once in two Years; from all which it is plain, that the Births may be 90, (and abating 15 for Sickness, young Abortions, and natural Barrenness) there may remain 75 Births, which is an Eighth of the People; which by some Observations we have found to be but a Two and thirtieth Part, or but a Quarter of what is thus shewn to be naturally possible. Now, according to this Reckoning, if the Births may be 75 of 600, and the Burials but 15, then the annual Increase of the People will be 60; and so the said 600 People may double in 10 Years,

Years, which differs yet more from 1200 above-mentioned. Now to get out of this Difficulty, and to temper those vast Disagreements, I took the Medium of 50 and 30 dying *per Annum*, and pitch'd upon 40; and I also took the Medium between 24 Births and 23 Burials, and 5 Births for 4 Burials, *viz*, allowing about 10 Births for 9 Burials; upon which Supposition there must die 15 *per Annum*, out of the above-mentioned 600, and the Births must be 16 and two Thirds, and the Increase 1, and two Thirds, or five Thirds of a Man; which Number compared with 1800 Thirds, or 600 Men, gives 360 Years for the Time of doubling (including some Allowance for Wars, Plagues, and Famine, the Effects whereof, though they be terrible at the Times and Places where they happen, yet in a Period of 360 Years, is no great Matter in the whole Nation.) For the Plagues of *England* in 20 Years hath carried away scarce an Eightieth Part of the whole Nation; and the late 10 Years Civil Wars, (the like whereof hath not been in several Ages before) did not take away above a fortieth Part of the whole People.

According to which Account or Measure of doubling, if there be now in *England* and *Wales*, 7 Millions 400 Thousand People, there were about 5 Millions 526 Thousand in the Beginning of *Queen Elizabeth's* Reign, *Anno* 1560, and about two Millions at the *Norman* Conquest, of which consult the *Doomsday-Book*,

and my Lord *Hale's Origination of Mankind.*

Memorandum, That if the People double in 360 Years, that the present 320 Millions computed by some learned Men, (from the Measures of all the Nations of the World, their Degrees of being peopled, and good Accounts of the People in several of them) to be now upon the Face of the Earth, will within the next 2000 Years, so increase, as to give one Head for every two Acres of Land in the habitable Part of the Earth. And then, according to the Prediction of the Scriptures, there must be Wars and great Slaughter, &c.

Wherefore, as an Expedient against the above-mentioned Difference between 10 and 12 hundred years, we do for the present, and in this Country admit of 360 years to be the Time wherein the People of *England* do double, according to the present Laws and Practice of Marriages.

Now, if the City double its People in 40 years, and the present Number be 670 Thousand, and if the whole Territory be 7 Millions 400 Thousand, and double in 360 years, as aforesaid; then by the underwritten Table it appears, that *Anno* 1840, the People of the City will be 10718880, and those of the whole Country but 10917389, which is but inconsiderably more. Wherefore it is certain and necessary that the Growth of the City must stop before the said Year 1840; and will be at its
utmost

utmost Height in the next preceeding Period, *Anno* 1800, when the Number of the City will be Eight times its present Number, *viz.* 5 Millions 359 Thousand. And when (besides the said Number) there will be 4 Millions 466 Thousand to perform the Tillage, Pasturage, and other rural Works necessary to be done without the said City, as by the following Table, *viz.*

	{ <i>Annis.</i> }	{ Burials. }	{ People in } { <i>London.</i> }	{ People in } { <i>England.</i> }
	1565 —	2568	77040	5526929.
As in the former Table. }	1605 —	5135		
	1642 —	11883		
	1682 —	22331	669930	7369230.
	1722 —	44662		
	1762 —	89324		
	1802 —	178648	5359440	9825650.
	1842 —	357296	10718889	10917389.

Now when the People of *London* shall come to be so near the People of all *England*, then it follows, that the Growth of *London* must stop before the said Year 1842, as aforesaid, and must be at its greatest Height *Anno* 1800, when it will be eight Times more than now, with above 4 Millions for the Service of the Country and Ports, as aforesaid.

Of the afore-mentioned vast Difference between 10 Years and 1200 Years for doubling the People, we make this Use, *viz.* To justify the Scriptures and all other good Histories concerning the Number of the People in ancient Time. For supposing the eight Persons who

came out of the Ark, increased by a progressive doubling in every 10 Years, might grow in the first 100 Years after the Flood from 8 to 8000, and that in 350 Years after the Flood (when about *Noah* died) to one Million, and by this Time 1682, to 320 Millions (which by rational Conjecture, are thought to be now in the World) it will not be hard to compute, how in the intermediate years, the Growths may be made, according to what is set down in the following Table, wherein making the doubling to be 10 Years at first, and within 1200 Years at last, we take a discretionary Liberty, but justifiable by Observations and the Scriptures for the rest; which Table we leave to be corrected by Historians, who know the Bigness of ancient Cities, Armies, and Colonies in the respective Ages of the World, in the mean Time affirming that without such Difference in the Measures and Periods for doubling (the Extreams whereof we have demonstrated to be real and true) it is impossible to solve what is written in the Holy Scriptures and other authentick Books. For if we pitch upon any one Number throughout for this Purpose, 150 Years is the fittest of all round Numbers; according to which, there would have been but 512 Souls in the whole World in *Moses's* Time (being 800 Years after the Flood) when 603 Thousand *Israelites* of above 20 Years Old (besides those of other Ages, Tribes, and Nations) were found upon an exact Survey appointed by
 God,

God, whereas our Table makes 12 Millions. And there would have been but 8000 in *David's* Time, when were found 1100 Thousand of above 20 Years old (besides others, as afore-said) in *Israel*, upon the Survey instigated by Satan, whereas our Table makes 32 Millions. And there would have been but a Quarter of a Million about the Birth of Christ, or *Augustus* his Time, when *Rome* and the *Roman* Empire were so great, whereas our Table makes 100 Millions. Where note, that the *Israelites* in about 500 Years between their coming out of *Egypt* to *David's* Reign, increased from 603 Thousand to 1100 Thousand.

On the other Hand, if we pitch upon a less Number, as 100 Years, the World would have been over-peopled 700 Years since. Wherefore no one Number will solve the Phenomena, and therefore we have supposed several in Order to make the following Table, which we again desire Historians to correct, according to what they find in Antiquity concerning the Number of the People in each Age and Country of the World.

We did (not long since) assist a worthy Divine, writing against some Scepticks, who would have baffled our Belief of the Resurrection, by saying, that the whole Globe of the Earth could not furnish Matter enough for all the Bodies that must rise at the last Day, much less would the Surface of the Earth furnish Footing for so vast a Number; whereas we did
(by

(by the Method aforementioned) assert the Number of Men now living, and also of those that had died since the Beginning of the World, and did withal shew, that half the Island of *Ireland* would afford them all, not only Footing to stand upon; but Graves to lie down in, for that whole Number; and that two Mountains in that Country were as weighty as all the Bodies that had ever been from the Beginning of the World to the Year 1680, when this Dispute happened. For which Purpose, I have digressed from my intended Purpose, to insert this Matter, intending to prosecute this Hint further, upon some more proper Occasion.

A Table

A Table shewing how the People might have doubled in the several Ages of the World.

Anno after the Flood.

Periods of doubling,	{ 1	————	8 Persons.
	10	————	16
	20	————	32
	30	————	64

1000	3700	————	256
In 300	{		
1000	4000	————	320

It is here to be noted, that in this Table we have assigned a different Number of Years for the Time of doubling the People in the several Ages of the World, and might have done the same

same for the several Countries of the World, and therefore the said several Periods assigned to the whole World in the Lump, may well enough consist with the 360 Years especially assigned to *England*, between this Day, and the *Norman* Conquest; and the said 360 Years may well enough serve for a Supposition between this Time, and that of the Worlds being fully peopled; nor do we lay any Stress upon one or the other in this Disquisition concerning the Growth of the City of *London*.

We have spoken of the Growth of *London*, with the Measures and Periods thereof, we come next to the Causes and Consequences of the same.

The Causes of its Growth from 1642 to 1682, may be said to have been as followeth, viz. From 1642 to 1650, that Men came out of the Country to *London*, to shelter themselves from the Outrages of the Civil Wars, during that Time; from 1650 to 1660, the Royal Party came to *London*, for their more private and inexpensive Living; from 1660 to 1670, the King's Friends and Party came to receive his Favours after his happy Restauration; from 1670 to 1680, the Frequency of Plots and Parliaments, might bring extraordinary Numbers to the City; but what Reasons to assign for the like Increase from 1604 to 1642, I know not, unless I should pick out some remarkable Accident happening in each Part of the said Period, and make that to be the Cause of this Increase

(as vulgar People make the Cause of every Man's Sickness, to be what he did last eat) wherefore, rather than so to say *quidlibet de quolibet*; I had rather quit even what I have above-said to be the Cause of *London's* Increase from 1642 to 1682, and put the whole upon some natural and spontaneous Benefits and Advantages that Men find by living in great more than in small Societies; and shall therefore seek for the antecedent Causes of this Growth, in the Consequences of the like, considered in greater Characters and Proportions.

Now, whereas in Arithmetick, out of two false Positions the Truth is extracted, so I hope out of two extravagant contrary Suppositions, to draw forth some solid and consistent Conclusion, *viz.*

The first of the said two Suppositions is, that the City of *London* is seven Times bigger than now, and that the Inhabitants of it are four Millions 690 Thousand People, and that in all the other Cities, Ports, Towns, and Villages, there are but 2 Millions 710 Thousand Men.

The other Supposition is, that the City of *London* is but a seventh Part of its present Bigness, and that the Inhabitants of it are but 96 Thousand, and that the rest of the Inhabitants (being 7 Millions 304 Thousand) do co-habit thus, 104 Thousand of them in small Cities and Towns, and that the rest, being 7 Millions 200 Thousand, do inhabit in Houses not contiguous to one another, *viz.* In 1200 Thousand Houses,

Houses, having about 24 Acres of Ground belonging to each of them, accounting about 28 Millions of Acres to be in the whole Territory of *England, Wales*, and the adjacent Islands; which any Man that pleases may examine upon a good Map.

Now, the Question is, in which of these two imaginary States, would be the most convenient, commodious, and comfortable Livings?

But this general Question divides itself into the several Questions, relating to the following Particulars, *viz.*

1. For the Defence of the Kingdom against foreign Powers.

2. For preventing the intestine Commotions of Parties and Factions.

3. For Peace and Uniformity in Religion.

4. For the Administration of Justice.

5. For the proportionably taxing of the People, and easy levying the same.

6. For Gain by foreign Commerce.

7. For Husbandry, Manufacture, and for Arts of Delight and Ornament.

8. For lessening the Fatigue of Carriages and Travelling.

9. For preventing Beggars and Thieves.

10. For the Advancement and Propagation of useful Learning.

11. For increasing the People by Generation.

12. For preventing the Mischiefs of Plagues and Contagions. And withal, which of the
said

faid two States is most practicable and natural; for in these and the like Particulars, do lie the Tests and Touch-stones of all Proposals, that can be made for the publick Good.

First, as to practicable, we say, that although our said extravagant Proposals are both in Nature possible, yet it is not obvious to every Man to conceive, how *London*, now seven Times bigger than in the Beginning of *Queen Elizabeth's* Reign, should be seven Times bigger than now it is, and 49 Times bigger than *Anno* 1560. To which I say, 1. That the present City of *London* stands upon less than 2500 Acres of Ground, wherefore a City seven Times as large may stand upon 10500 Acres, which is about equivalent to a Circle of four Miles and a half in Diameter, and less than 15 Miles in Circumference. 2. That a Circle of Ground of 35 Miles Semidiameter will bear Corn, Garden-stuff, Fruits, Hay, and Timber for the four Millions 690 Thousand Inhabitants of the said City and Circle, so as nothing of that Kind need be brought from above 35 Miles Distance from the said City; for the Number of Acres within the said Circle, reckoning two Acres sufficient to furnish Bread and Drink-Corn for every Head, and two Acres will furnish Hay for every necessary Horse; and that the Trees which may grow in the Hedge-rows of the Fields within the said Circle, may furnish Timber for 600 Thousand Houses. 3. That all live Cattle and great Animals can bring them-

themselves to the said City; and that Fish can be brought from the Land's End, and *Berwick*, as easily as now. 4. Of Coals there is no Doubt: And for Water, 20 *s. per Family* (or 600 Thousand Pounds *per Annum* in the whole) will serve this City, especially with the Help of the *New-River*. But if by practicable be understood, that the present State may be suddenly changed into either of the two above-mentioned Proposals, I think it is not practicable. Wherefore the true Question is, unto or towards which of the said two extravagant States it is best to bend the present State by Degrees, *viz.* Whether it be best to lessen or enlarge the present City? In Order whereunto, we enquire (as to the first Question) which State is most defensible against foreign Powers, saying, that if the above-mentioned Housing, and a Border of Ground, of 3 Quarters of a Mile broad, were encompassed with a Wall and Ditch of 20 Miles about (as strong as any in *Europe*, which would cost but a Million, or about a Penny in the Shilling of the House-Rent for one Year) what foreign Prince could bring an Army from beyond Seas, able to beat, 1. Our Sea-Forces, and next with Horse harrassed at Sea, to resist all the fresh Horse that *England* could make, and then conquer above a Million of Men, well united, disciplin'd, and guarded within such a Wall, distant every-where 3 Quarters of a Mile from the Housing, to elude the Granadoes and great Shot of the Enemy? 2. As to
 in-

intestine Parties and Factions, I suppose that 4 Millions 690 Thousand People united within this great City, could easily govern half the said Number scattered without it, and that a few Men in Arms within the said City and Wall, could also easily govern the rest unarmed, or armed in such a Manner as the Sovereign shall think fit. 3. As to Uniformity in Religion, I conceive, that if St. *Martins* Parish may (as it doth) consist of about 40 Thousand Souls, that this great City also may as well be made but as one Parish, with 7 Times 130 Chapels, in which might not only be an Uniformity of Common Prayer, but in Preaching also; for that a thousand Copies of one judiciously and authentically composed Sermon, might be every Week read in each of the said Chapels without any subsequent Repetition of the same, as in the Case of Homilies. Whereas in *England* (wherein are near 10 Thousand Parishes, in each of which upon Sundays, Holy-days, and other extraordinary Occasions, there should be about 100 Sermons *per Annum*, making about a Million of Sermons *per Annum* in the whole :) It were a Miracle, if a Million of Sermons composed by so many Men, and of so many Minds and Methods, should produce Uniformity upon the discomposed Understandings of about 8 Millions of Hearers.

4. As to the Administration of Justice. If in this great City shall dwell the Owners of all the Lands, and other valuable Things in *England*;

land; if within it shall be all the Traders, and all the Courts, Offices, Records, Juries, and Witnesses; then it follows, that Justice may be done with Speed and Ease.

5. As to the Equality and easy levying of Taxes. It is too certain, that *London* hath at some Times paid near half the Excise of *England*; and that the People pay thrice as much for the Hearths in *London* as those in the Country, in Proportion to the People of each, and that the Charges of collecting these Duties have been about a Sixth Part of the Duty itself. Now, in this great City, the Excise alone, according to the present Laws, would not only be double to the whole Kingdom, but also more equal. And the Duty of Hearths of the said City, would exceed the present Proceed of the whole Kingdom. And as for the Customs, we mention them not at present.

6. Whether more would be gain'd by foreign Commerce?

The Gain which *England* makes by Lead, Coals, the Freight of Shipping, &c. may be the same, for aught I see, in both Cases. But the Gain which is made by Manufactures, will be greater, as the Manufacture itself is greater and better. For in so vast a City Manufactures will beget one another, and each Manufacture will be divided into as many Parts as possible, whereby the Work of each Artisan will be simple and easy: As for Example; in the making of a Watch, if one Man shall make the
Wheels,

Wheels, another the Spring, another shall engrave the Dial-plate, and another shall make the Cases, then the Watch will be better and cheaper, than if the whole Work be put upon any one Man. And we also see that in Towns, and in the Streets of a great Town, where all the Inhabitants are almost of one Trade, the Commodity peculiar to those Places is made better and cheaper than elsewhere. Moreover, when all Sorts of Manufactures are made in one Place, there every Ship that goeth forth, can suddenly have its Loading of so many several Particulars and Species, as the Port whereunto she is bound can take off. Again, when the several Manufactures are made in one Place, and shipped off in another, the Carriage, Postage, and Travelling-charges, will inhance the Price of such Manufacture, and lessen the Gain upon foreign Commerce. And lastly, when the imported Goods are spent in the Port itself where they are landed, the Carriage of the same into other Places, will create no Surcharge upon such Commodity; all which Particulars tend to the greater Gain by foreign Commerce.

7. As for Arts of Delight and Ornament.

They are best promoted by the greatest Number of Emulators. And it is more likely that one ingenious curious Man may rather be found out amongst 4 Millions than 400 Persons. But as for Husbandry, *viz.* Tillage and Pasturage, I see no Reason, but the second State (when each Family is charged with the Culture of about 24 Acres) will best promote the same.

8. As for lessening the Fatigue of Carriage and Travelling.

The Thing speaks itself; for if all the Men of Business, and all Artisans do live within five Miles of each other; and if those who live without the great City, do spend only such Commodities as grow where they live, then the Charge of Carriage and Travelling could be little.

9. As to the preventing of Beggars and Thieves.

I do not find how the Differences of the said two States should make much Difference in this Particular; for Impotents (which are but one in about 600) ought to be maintained by the rest. 2. Those who are unable to work, through the evil Education of their Parents, ought (for aught I know) to be maintained by their nearest Kindred, as a just Punishment upon them. 3. And those who cannot find Work (though able and willing to perform it) by Reason of the unequal Application of Hands to Lands, ought to be provided for by the Magistrate and Landlord till that can be done; for there need be no Beggars in Countries, where there are many Acres of unimproved improvable Land to every Head, as there are in *England*. As for Thieves, they are for the most Part begotten from the same Cause; for it is against Nature, that any Man should venture his Life, Limb, or Liberty, for a wretched Livelihood, whereas moderate Labour will produce a better.

But

But of this see Sir *Thomas Moore*, in the first Part of his *Utopia*.

10. As to the Propagation and Improvement of useful Learning.

The same may be said concerning it, as was above-said concerning Manufactures, and the Arts of Delight and Ornaments; for in the great vast City, there can be no so odd a Conceit or Design, whereunto some Assistance may not be found, which in the thin scattered Way of Habitation may not be.

11. As for the Increase of People by Generation.

I see no great Difference from either of the two States, for the same may be hindred or promoted in either, from the same Causes.

12. As to the Plague.

It is to be remembered, that one Time with another, a Plague happeneth in *London* once in 20 Years, or thereabouts; for in the last hundred Years, between the Years 1582 and 1682, there have been five great Plagues, viz. *Anno* 1592, 1603, 1625, 1636, and 1665. And it is also to be remembered, that the Plagues of *London* do commonly kill one fifth Part of the Inhabitants. Now, if the whole People of *England* do double but in 360 Years, then the annual Increase of the same is but 20000, and in 20 Years 400000. But if in the City of *London* there should be two Millions of People (as there will be about 60 Years hence) then the Plague (killing one Fifth of them, namely,

400000, once in 20 Years) will destroy as many in one Year, as the whole Nation can re-furnish in 20: And consequently the People of the Nation shall never increase. But if the People of *London* shall be above 4 Millions (as in the first of our two Extravagant Suppositions is premised) then the People of the whole Nation shall lessen above 20000 *per Annum*. So as if People be worth 70 *l. per Head* (as hath elsewhere been shewn) then the said Greatness of the City will be a Damage to itself and the whole Nation of 14 hundred Thousand Pounds *per Annum*, and so *pro rata*, for a greater or lesser Number; wherefore to determine, which of the two States is best, (that is to say, towards which of the said two States Authority should bend the present State) a just Balance ought to be made between the Disadvantages from the Plague, with the Advantages accruing from the other Particulars above-mentioned; unto which Balance a more exact Account of the People, and a better Rule for the Measure of its Growth is necessary, than what we have here given, or are yet able to lay down.

P O S T -

P O S T S C R I P T.

IT was not very pertinent to a Discourse concerning the City of *London*, to thrust in Considerations of the Time when the whole World will be fully peopled ; and how to justify the Scriptures concerning the Number of People mentioned in them ; and concerning the Number of the Quick and the Dead, that may rise at the last Day, &c. Nevertheless, since some Friends liking the said Digressions and Imperinencies (perhaps as Sauce to a dry Discourse) have desired that the same might be explained and made out : I therefore say as followeth.

1, If the Number of Acres in the habitable Part of the Earth, be under 50 Thousand Millions ; if twenty Thousand Millions of People, are more than the said Number of Acres will feed ; (few or no Countries being so fully peopled) and for that in six Doublings (which will be in 2000 Years) the present 320 Millions will exceed the said 20 Thousand Millions.

2. That the Number of all those who have died since the Flood, is the Sum of all the Products made by multiplying the Number of the doubling Periods mentioned in the first Column of the last Table, by the Number of People respectively affixed to them, in the third Column of the same Table ; the said Sum being divided by 40 (one dying out of 40 *per Annum*, out of the whole Mass of Mankind) which Quotient

is 12570 Millions; whereunto may be added for those that died before the Flood, enough to make the last-mentioned Number 20 Thousand Millions, as the full Number of all that died, from the Beginning of the World, to the Year 1682; unto which, if 320 Millions, the Number of those who are now alive, be added, the Total of the Quick and the Dead, will amount but unto one fifth Part of the Graves, which the Surface of *Ireland* will afford, without ever putting two Bodies into any one Grave; for there be in *Ireland* 28 Thousand square *English* Miles, each whereof will afford about 4 Millions of Graves, and consequently above 114 Thousand Millions of Graves, *viz.* about five Times the Number of the Quick and the Dead, which should arise at the last Day, in case the same had been in the Year 1682.

3. Now, if there may be Place for five Times as many Graves in *Ireland*, as are sufficient for all that ever died; and if the Earth of one Grave weigh five Times as much as the Body interr'd therein, then a Turf, less than a Foot thick, pared off from a fifth Part of the Surface of *Ireland*, will be equivalent in Bulk and Weight to all the Bodies that ever were buried; and may serve as well for that Purpose, as the two Mountains afore-mentioned in the Body of this Discourse. From all which it is plain, how madly they were mistaken, who did so petulantly vilify what the Holy Scriptures have delivered.

TH E Observations upon the *London* Bills of Mortality have been a new Light to the World ; and the like Observation upon those of *Dublin*, may serve as Snuffers to make the same Candle burn clearer.

The *London* Observations flowed from Bills regularly kept for near One hundred Years ; but these are squeezed out of six stragling *London* Bills, out of Fifteen *Dublin* Bills, and from a Note of the Families and Hearths in each Parish of *Dublin* ; which are all digested into the one Table or Sheet annexed, consisting of Three Parts, marked A, B, C ; being indeed the A, B, C, of publick Oeconomy, and even of that Policy which tends to Peace and Plenty.

Observations upon the Table A.

1. **T**H E total of the Burials in *London*, (for the said six stragling Years mentioned in the Table A) is 120170 ; whereof the Medium or sixth Part is 20028 ; and exceeds the Burials of *Paris*, as may appear by the late Bills of that City.
2. The

2. The Births, for the same Time, are 73683, the Medium or sixth Part whereof is 12280, which is about five eighth Parts of the Burials; and shews, that *London* would in Time decrease quite away, were it not supplied out of the Country, where are about five Births for four Burials, the Proportion of Breeders in the Country being greater than in the City.

3. The Burials in *Dublin* for the said six Years, were 9865, the sixth Part or Medium whereof is, 1644, which is about the twelfth Part of the *London* Burials; and about a fifth Part over. So as the People of *London* do hereby seem to be above twelve Times as many as those of *Dublin*,

4. The Births in the same Time at *Dublin*, are 6157, the sixth Part or Medium whereof is 1026, which is also about five eighth Parts of the 1644 Burials; which shews, that the Proportion between Burials and Births are alike at *London* and *Dublin*, and that the Accompts are kept alike; and consequently are likely to be true, there being no Confederacy for that Purpose: Which if they be true, we then say,

5. That the Births are the best Way (till the Accompts of the People shall be purposely taken) whereby to judge of the Increase and Decrease of People, that of Burials being subject to more Contingencies and Variety of Causes.

6. If Births be as yet the Measure of the People, and that the Births (as has been shewn) are as five to eight, then eight fifths of the Births is the Number of the Burials, where the Year was

not considerable for extraordinary Sickness or Salubrity; and is the Rule whereby to measure the same. As for Example: The Medium of Births in *Dublin* was 1026, the eight fifths whereof is 1641, but the real Burials were 1644; so as in the said Years they differed little from the 1641, which was the Standard of Health: and consequently, the Years 1680, 1674, and 1668, were sickly Years, more or less, as they exceeded the said Number 1641; and the rest were healthful Years, more or less, as they fell short of the same Number. But the City was more or less populous, as the Births differed from the Number 1026; *viz.* populous in the Years 1680, 1679, 1678, and 1668: For other Causes of this Difference in Births are very occult and uncertain.

7. What hath been said of *Dublin*, serves also for *London*.

8. It hath already been observ'd by the *London* Bills, that there are more Males than Females. It is to be further noted, that in these six *London* Bills also, there is not one Instance either in the Births or Burials to the contrary.

9. It hath been formerly observ'd, that in the Years wherein most dye, fewest are born, and *vice versâ*. The same may be further observed in Males and Females, *viz.* When fewest Males are born, then most dye: for here the Males dyed as Twelve to Eleven, which is above the mean Proportion of Fourteen to Thirteen; but were born but as Nineteen to Eighteen, which is below the same.

Observations upon the Table B.

1. FROM the Table B, it appears, that the Medium of the fifteen Years Burials, (being 24199) is 1613, whereas the Medium of the other six Years in the Table A, was 1644, and that the Medium of the fifteen Years Births (being in all 14795) is 984, whereas the Medium of the said other six Years, was 1026. That is to say, there were both fewer Births and Burials in these fifteen Years, than in the other six Years; which is a probable Sign that at a Medium there were fewer People also.

2. The Medium of Births for the fifteen Years being 984, whereof eight Fifths (being 1576) is the Standard of Health for the said fifteen Years; and the Triple of the said 1576, being 4728, is the Standard for each of the Ternaries of the fifteen Years within the said Table.

3. That 2952, the Triple of 984 Births, is for each Ternary the Standard of Peoples Increase and Decrease from the Year 1666 to 1680 inclusive, *viz.* The People increased in the second Ternary, and decreased from the same in the third and fourth Ternaries, but re-increased in the fifth Ternary beyond any other.

4. That the last Ternary was withal very healthful, the Burials being but 4624, *viz.* below 4728, the Standard.

5. That according to this Proportion of Increase, the Houses of *Dublin* have probably increased also.

Observations upon the Table C.

1. **F**IRST, from the Table C, it appears, 1. That the Housing of *Dublin* is such, as that there are not five Hearths in each House one with another, but nearer five than four.
2. That in *St. Warburgh's* Parish are near six Hearths to an House. In *St. John's* five. In *St. Michael's* above five. In *St. Nicholas within* above six. In *Christ-Church* above seven. In *St. James's*, and *St. Catherine's*, and in *St. Michan's*, not four. In *St. Kevan's* about four.
3. That in *St. James's*, *St. Michan's*, *St. Bride's*, *St. Warburgh*, *St. Andrew's*, *St. Michael's*, and *St. Patrick's*, all the Christenings were but 550, and the Burials 1055, viz. near double; and that in the rest of the Parishes the Christenings were five, and the Burials seven, viz. as 457 to 634. Now whether the Cause of this Difference were Negligence in Accompts, or the Greaterness of the Families, &c. is worth inquiring.
4. It is hard to say in what Order (as to Greatness) these Parishes ought to stand, some having most Families; some most Hearths, some most Births, and others most Burials. Some Parishes exceeding the rest in two, others in three of the said four Particulars, but none in all four. Wherefore this Table ranketh them according to the Plurality of the said four Particulars wherein each excelleth the other.
5. The *London* Observations reckon eight Heads to be in each Family; according to which Estimation, there are 32000 Souls in the 4000 Families.

Families of *Dublin*; which is but half of what most Men imagine; of which but about one sixth Part are able to bear Arms, besides the Royal Regiment.

6. Without the Knowledge of the true Number of People, as a Principle, the whole Scope and Use of the keeping Bills of Births and Burials is impaired; wherefore by laborious Conjectures and Calculations to deduce the Number of People from the Births and Burials, may be ingenious, but very preposterous.

7. If the Number of Families in *Dublin* be about 4000, then ten Men, in one Week (at the Charge of about five Pound, surveying eight Families in an Hour) may directly, and without Algebra, make an Account of the whole People, expressing their several Ages, Sex, Marriages, Title, Trade, Religion, &c. and those who survey the Hearths, or the Constables or Parish-Clerks, (may, if required) do the same *ex Officio*, and without other Charge, by the Command of the chief Governor, the Diocesan, or the Mayor.

8. The Bills of *London* have since their Beginning, admitted several Alterations and Improvements; and eight or ten Pound *per Annum* Surcharge, would make the Bills of *Dublin* to exceed all others, and become an excellent Instrument of Government. To which Purpose the Forms for Weekly, Quarterly, and Yearly Bills are humbly recommended, *viz.*

S T A T I O N E R.

WHEREAS you complain, that these Observations make no sufficient Bulk, I could answer you, that I wish the Bulk of all Books were less; but do nevertheless comply with you in adding what follows, *viz.*

1. That the Parishes of *Dublin* are very unequal; some having in them above six Hundred Families, and others under Thirty.

2. That thirteen Parishes are too few for four Thousand Families; the middling Parishes of *London* containing One hundred and twenty Families; according to which Rate, there should be about Thirty three Parishes in *Dublin*.

3. It is said, that there are eighty four Thousand Houses or Families in *London*, which is twenty-one Times more than are in *Dublin*; and yet the Births and Burials of *London* are but twelve Times those of *Dublin*: which shews, that the Inhabitants of *Dublin* are more crowded and streightned in their Housing, than those

those of *London*; and consequently, that to increase the Buildings of *Dublin*, will make that City more conformable to *London*.

4. I shall also add some Reasons for altering the present Forms of the *Dublin* Bills of Mortality, according to what hath been here recommended, *viz.*

1. We give the Distinctions of Males and Females in the Births only; for that the Burials must, at one Time or another, be in the same Proportion with the Births.

2. We do in the Weekly and Quarterly Bills propose, that Notice be taken in the Burials of what Numbers dye above Sixty and Seventy, and what under Sixteen, Six, and two Years old; foreseeing good Uses to be made of that Distinction.

3. We do in the yearly Bill, reduce the Casualties to about Twenty-four, being such as may be discerned by common Sense and without Art; conceiving that more will but perplex and imbroil the Account. And in the Quarterly Bills, we reduce the Diseases to three Heads, *viz.* contagious, acute, and chronical; applying this Distinction to Parishes, in Order to know how the different Situation, Soil, and Way of living in each Parish, doth dispose Men to each of the said three Species: and in the Weekly Bills we take Notice not only of the Plague, but of the other contagious Diseases in each Parish; that Strangers and fearful Persons may thereby know how to dispose of themselves.

4. We

4. We mention the Number of the People, as the fundamental Term in all our Proportions, and without which, all the rest will be almost fruitless.

5. We mention the Number of Marriages made in every Quarter, and in every Year; as also the Proportion which married Persons bear to the whole; expecting in such Observations to read the Improvement of the Nation.

6. As for Religions, we reduce them to three, *viz.* 1. Those who have the Pope of *Rome* for their Head. 2. Who are governed by the Laws of their Country. 3. Those who rely respectively upon their own private Judgments. Now whether these Distinctions should be taken Notice of or not, we do but faintly recommend, seeing many Reasons *pro* and *con* for the same: and therefore although we have mentioned it as a Matter fit to be considered, yet we humbly leave it to Authority.

Further Observations upon the Dublin Accountts of Baptifms and Burials, Houfes and Heartbs.

THE Table hath been made for the Year 1682, wherein is to be noted,

1. That the Houfes which *Anno* 1671, were but 3850 are *Anno* 1682, 6025; but whether this Difference is caufed by the real Encrease of Houfing, or by Fraud and Defect in the former Accountts, is left to Confideration. For the Burials or People have increased but from 1696, to 2263, according to which Proportion, the 3850 Houfes *Anno* 1671, fhould *Anno* 1682 have been but 5143, wherefore fome Fault may
be

be suspected as aforesaid, when farming the Hearth-money was in Agitation.

2. The Hearths have encreased according to the Burials, and $\frac{1}{3}$ of the said Increase more, *viz.* The Burials *Anno* 1671 were 1696, the $\frac{1}{3}$ whereof is 563, which put together makes 2259, which is near the Number of Burials *Anno* 1682. But the Hearths *Anno* 1671, were 17500, whereof the $\frac{1}{3}$ is 5833, making in all but 23333; whereas the whole Hearths *Anno* 1682 were 25369, *viz.* $\frac{1}{3}$ and better of the said 5833 more.

3. The Houses were *Anno* 1671, but 3850, which if they had increased *Anno* 1682 but according to the Burials, they had been but 5143, or according to the Hearths, had been but 5488, whereas they appear 6025, increasing double to the Hearths. So as 'tis likely there hath been some Error in the said Account of the Houses, unless the new Houses be very small, and have but one Chimney a piece, and that $\frac{1}{4}$ Part of them are untenanted. On the other Hand, 'tis more likely that when 1696 died *per An.* there were near 6000; for 6000 Houses at 8 Inhabitants *per* House, would make the Number of the People to be 48 Thousand, and the Number of 1696 that died according to the Rule of 1 out of 30, would have made the Number of Inhabitants about 50 Thousand: For which Reason I continue to believe there was some Error in the Accompt of 3850 Houses as aforesaid, and the rather because there is no Ground from
Expe-

Experience to think that in 11 Years, the Houses in *Dublin* have increased from 3850 to 6025.

Moreover, I rather think that the Number of 6025 is yet short, because that Number at 8 Heads *per* House makes the Inhabitants to be but 48200; whereas the 2263 who died in the Year 1682, according to the aforementioned Rule of one dying out of 30 makes the Number of People to be 67890; the Medium betwixt which Number and 48200 is 58045, which is the best Estimate I can make of that Matter, which I hope Authority will ere long rectify, by direct and exact Enquiries.

4. As to the Births, we say that *Anno* 1640, 1641, and 1642, at *London*, just before the Troubles in Religion began, the Births were $\frac{2}{3}$ of the Burials, by Reason I suppose of the Greatness of Families in *London* above the Country, and the fewer Breeders, and not for Want of registering. Wherefore deducting $\frac{2}{3}$ of 2263, which is 377, there remains 1886 for the probable Number of the Births in *Dublin* for the Year 1682; whereas but 912 are represented to have been christen'd in that Year, though 1023 were christen'd *Anno* 1671, when there died but 1696; which Decreasing of the Christenings, and Increasing of the Burials, shews the Increase of Non-registering in the legal Books, which must be the Increase of *Roman Catholicks* at *Dublin*.

The

The Scope of this whole Paper therefore is, That the People of *Dublin* are rather 58000, than 32000; and that the Dissenters, who do not register their Baptisms, have increased from 391 to 974: but of Dissenters, none have increased but the *Roman Catholics*, whose Numbers have increased from about 2 to 5 in the said Years. The exacter Knowledge whereof, may also be better had from direct Enquiries.

POLITICAL ARITHMETICK,
Concerning
The People, Houſing, Hoſpitals, &c.
O F
LONDON and PARIS.

By Sir WILLIAM PETTY, *Fellow of the
Royal Society.*

——— *Qui ſciret Regibus uti
Faſtidiret olus* ——

(56)

T O T H E

K I N G ' S

Most Excellent MAJESTY.

I Do presume, in a very small Paper, to shew your Majesty, that your City of *London* seems more considerable than the two best Cities of the *French* Monarchy, and for ought I can find, greater than any other of the Universe; which because I can say without Flattery, and by such Demonstration as your Majesty can examine, I humbly pray your Majesty to accept from

Your MAJESTY'S

Most Humble, Loyal,

and Obedient Subject,

WILLIAM PETTY.

A N
E S S A Y
I N
POLITICAL ARITHMETICK,
By Sir WILLIAM PETTY,

Tending to prove that London hath more People and Houses than the Cities of Paris and Rouen put together, and is also more considerable in several other Respects.

1. **T**HE Medium of the Burials at *London* in the three last Years, viz. 1683, 1684 and 1685, (wherein there was no extraordinary Sickness, and wherein the Christenings do correspond in their ordinary Proportions with the Burials and Christenings of each Year one with another) was 22337, and the like Medium of Burials for the three last *Paris* Bills we could procure, viz. for the Years 1682, 1683, and 1684 (whereof the last as appears by the Christenings to have been very sickly) is 19887.

2. The City of *Bristol* in *England* appears to be by good Estimate of its Trade and Customs,

as great as *Rouen* in *France*, and the City of *Dublin* in *Ireland* appears to have more Chimnies than *Bristol*, and consequently more People, and the Burials in *Dublin* were *Anno* 1682 (being a sickly Year) but 2263:

3. Now the Burials of *Paris* (being 19887) being added to the Burials of *Dublin* (supposed more than at *Rouen*) being 2263, makes but 22150, whereas the Burials of *London* were 187 more, or 22337, or as about 6 to 7.

4. If those who die unnecessarily, and by Miscarriage in *L' Hostel Dieu* in *Paris* (being above 3000) as hath been elsewhere shewn, or any Part thereof, should be subtracted out of the *Paris* Burials afore-mentioned, then our Assertion will be stronger, and more proportionable to what follows concerning the Houses of those Cities, *viz.*

5. There were burnt at *London*, *Anno* 1666, above 13000 Houses, which being but a fifth Part of the whole, the whole Number of Houses in the said Year, were above 65000; and whereas the ordinary Burials of *London* have increased between the Years 1666 and 1686, above one third, the Total of the Houses at *London* *Anno* 1686, must be about 87000, which *Anno* 1682, appeared by Account to have been 84000.

6. *Monsieur Morery*, the great *French* Author of the late *Geographical Dictionaries*, who makes *Paris* the greatest City in the World, doth reckon but 50000 Houses in the same, and other Authors and knowing Men much less; nor are there

there full 7000 Houses in the City of *Dublin*; so as if the 50000 Houses of *Paris* and the 7000 Houses in the City of *Dublin* were added together, the Total is but 57000 Houses; whereas those of *London* are 87000 as aforesaid, or as 6 to 9.

7. As for the Shipping and foreign Commerce of *London*, the common Sense of all Men doth judge it to be far greater than that of *Paris* and *Rouen* put together.

8. As to the Wealth and Gain accruing to the Inhabitants of *London* and *Paris* by Law-suits (or *La Cbicané*) I only say that the Courts of *London* extend to all *England* and *Wales*, and affect seven Millions of People, whereas those of *Paris* do not extend near so far: Moreover there is no palpable conspicuous Argument at *Paris* for the Number and Wealth of Lawyers like the Buildings and Chambers in the two *Temples*, *Lincoln's Inn*, *Gray's Inn*, *Doctors Commons*, and the seven other Inns, in which are Chimnies, which are to be seen at *London*, besides many Lodgings, Halls, and Offices relating to the same.

9. As to the plentiful and easy living of the People we say,

1. That the People of *Paris* to those of *London*, being as about 6 to 7, and the Houses of the same as about 6 to 9, we infer that the People do not live at *London* so close and crouded as at *Paris*, but can afford themselves more Room and Liberty.

E

2. That

2. That at *London* the Hospitals are better and more desirable than those of *Paris*, for that in the best at *Paris* there die 2 out of 15, whereas at *London* there die out of the worst scarce 2 of 16, and yet but a fiftieth Part of the whole die out of the Hospitals at *London*, and $\frac{2}{5}$ or 20 Times that Proportion die out of the *Paris* Hospitals which are of the same Kind; that is to say, the Number of those at *London* who chuse to lie sick in Hospitals rather than in their own Houses, are to the like People of *Paris* as one to twenty; which shews the greater Poverty or Want of Means in the People of *Paris* than those of *London*.

3. We infer from the Premises, viz. the dying scarce 2 of 16 out of the *London* Hospitals, and about 2 of 15 in the best of *Paris*, (to say nothing of *L' Hostel Dieu*) that either the Physicians and Chirurgeons of *London* are better than those of *Paris*, or that the Air of *London* is more wholesome.

10. As for the other great Cities of the World, if *Paris* were the greatest, we need say no more in Behalf of *London*. As for *Pequin* in *China*, we have no Account fit to reason upon; nor is there any thing in the Description of the two late Voyages of the *Chinese* Emperor from that City into East and West *Tartary*, in the Years 1682 and 1683, which can make us recant what we have said concerning *London*. As for *Dely* and *Agra* belonging to the Mogul, we find nothing against our Position, but much to shew

shew the vast Numbers which attend that Emperor in his Business and Pleasures.

11. We shall conclude with *Constantinople* and *Gran Cairo*; as for *Constantinople* it hath been said by one who endeavour'd to shew the Greatness of that City, and the Greatness of the Plague which reigned in it, that there died 1500 *per Diem*, without other Circumstances: To which we answer, that in the Year 1665 there died in *London* 1200 *per Diem*, and it hath been well proved that the Plague of *London* never carried away above $\frac{1}{5}$ of the People, whereas it is commonly believed that in *Constantinople*, and other Eastern Cities, and even in *Italy* and *Spain*, that the Plague takes away $\frac{2}{3}$ one half or more; wherefore where 1200 is but $\frac{1}{5}$ of the People, it is probable that the Number was greater, than where 1500 was $\frac{2}{3}$ or one half, &c.

12. As for *Gran Cairo* it is reported, that 73000 died in 10 Weeks or 1000 *per Diem*, where note, that at *Gran Cairo* the Plague comes and goes away suddenly, and that the Plague takes away 2 or $\frac{3}{4}$ Parts of the People as aforesaid; so as 73000 was probably the Number of those that died of the Plague in one whole Year at *Gran Cairo*, whereas at *London Anno 1665*, 97000 were brought to Account to have died in that Year. Wherefore it is certain that that City wherein 97000 was but $\frac{1}{5}$ of the People, the Number was greater than where 73000 was $\frac{2}{3}$ or the half.

We therefore conclude, that *London* hath more People, Houfes, Shipping, and Wealth, than *Paris* and *Rouen* put together; and for ought yet appears, is more confiderable than any other City in the Univerfe, which was propounded to be proved.

A N
E S S A Y
I N
POLITICAL ARITHMETICK,
By Sir *WILLIAM PETTY*,

Tending to prove that in the Hospital called L'Hôtel Dieu at Paris, there die above 3000 per Annum, by Reason of ill Accommodation.

1. **I**T appears that *Anno* 1678 there entered into the Hospital of *La Charité* 2647 Souls, of which there died there within the said Year 338, which is above an eighth Part of the said 2647, and that in the same Year there entered into *L'Hôtel Dieu* 21491, and that there died out of that Number 5630, which is above one Quarter, so as about half the said 5630, being 2815, seem to have died for Want of as good Usage and Accommodation as might have been had at *La Charité*.

2. Moreover in the Year 1679 there entered into *La Charité* 3118, of which there died 452, which is above a seventh Part, and in the same year there entered into *L'Hôtel Dieu* 28635, of which there died 8397, and in both the said

Loss of the Subjects of *France* in that Hospital seems to be 60 Times 3506 Livres *Sterl. per Annum, viz.* 210 Thousand 360 Livres *Sterl.* equivalent to about two Millions 524 Thousand 320 *French* Livres.

7. It hath appeared that there came into *L' Hostel Dieu* at a Medium 25063 *per Annum*, or 2089 *per Menssem*, and that the whole Stock of what remained in the precedent Months is at a Medium about 2108 (as may appear by the third Line of the Table N^o 5, which shall be shortly published) *viz.* the Medium of Months is 2410 for the sickly Year 1679, whereunto 1806 being added, as the Medium of Months for the Year 1678, makes 4216, the Medium whereof is the 2108 above-mentioned; which Number being added to the 2089 which entered each Month, makes 4197 for the Number of Sick which are supposed to be always in *L' Hostel Dieu* one Time with another.

8. Now if 60 *French* Livres *per Annum* for each of the said 4197 sick Persons were added to the present ordinary Expence of that Hospital (amounting to an Addition of 251 Thousand 820 Livres) it seems that so many Lives might be saved as are worth above ten Times that Sum, and this by doing a manifest Deed of Charity to Mankind.

Memorandum, That Anno 1685, the Burials of London were 23222, and those of Amsterdam 6245; from whence, and the Difference of Air, 'tis probable that the People of London are quadruple to those of Amsterdam.

OBSERVATIONS
UPON THE
CITIES
OF
LONDON and ROME.

1. **T**HAT before the Year 1630, the Christenings at *London* exceeded the Burials of the same, but about the Year 1655 they were scarce half; and now about two Thirds.

2. Before the Restauration of Monarchy in *England*, Anno 1660, the People of *Paris* were more than those of *London* and *Dublin* put together, whereas now, the People of *London* are more than those of *Paris* and *Rome*, or of *Paris* and *Rouen*.

3. Anno 1665 one fifth Part of the then People of *London* or 97 Thousand died of the Plague, and in the next Year 1666, 13 Thousand Houses, or one fifth Part of all the Housing of *London* were burnt also.

4. At the Birth of *Christ*, old *Rome* was the greatest City of the World, and *London* the greatest

greatest at the Coronation of King *James* the Second, and near 6 Times as great as the present *Rome*, wherein are 119 Thousand Souls besides *Jews*.

5. In the Years of King *Charles* the Second his Death and King *James* the Second his Coronation (which were neither of them remarkable for extraordinary Sickliness or Healthfulness) the Burials did wonderfully agree, *viz.* *Anno* 1684, they were 23202, and *Anno* 1685 they were 23222, the Medium whereof is 23212. And the Christenings did very wonderfully agree also, having been *Anno* 1684, 14702, and *Anno* 1685, 14732, the Medium whereof is 14717, which Consistence was never seen before, the said Number of 23212 Burials making the People of *London* to be 696360, at the Rate of one dying *per Annum* out of 30.

6. Since the great Fire of *London*, *An.* 1666 about 7 Parts of 15 of the present vast City hath been new built, and is with its People increased near one half, and become equal to *Paris* and *Rome* put together, the one being the Seat of the great *French* Monarchy, and the other of the Papacy.

FIVE ESSAYS

IN

POLITICAL ARITHMETICK,

VIZ.

- I. Objections from the City of *Rey* in *Persia*, and from Monsieur *Auzout*, against two former Essays, answered, and that *London* hath as many People as *Paris*, *Rome*, and *Rouen* put together.
- II. A Comparison between *London* and *Paris* in 14 Particulars.
- III. Proofs that at *London*, within its 134 Parishes named in the Bills of Mortality, there live about 696 Thousand People.
- IV. An Estimate of the People in *London*, *Paris*, *Amsterdam*, *Venice*, *Rome*, *Dublin*, *Bristol*, and *Rouen*, with several Observations upon the same.
- V. Concerning *Holland*, and the rest of the Seven *United Provinces*.

By Sir WILLIAM PETTY, *Fellow of the Royal Society.*

Invidiam augendo ulciscar.

T O T H E

K I N G ' S

Most Excellent MAJESTY.

S I R,

YOUR Majesty having graciously accepted my two late Essays about the Cities and Hospitals of *London* and *Paris*, as also my Observations on *Rome* and *Rouen*; I do (after six Months waiting for what may be said against my several Doctrines, by the able Men of *Europe*) humbly present your Majesty with a few other Papers upon the same Subject, to strengthen, explain and enlarge the former; hoping by such real Arguments, better to praise and magnify your Majesty, than by any other the most specious Words and Elogies that can be imagined by

Your MAJESTY'S

*Most Humble, Loyal,
and Obedient Subject,*

1687,

WILLIAM PETTY.

 The FIRST ESSAY.

IT could not be expected that an Assertion of *London's* being bigger than *Paris* and *Rouen*, or than *Paris* and *Rome* put together, and bigger than any City of the World, should escape uncontradicted ; and 'tis also expected, that I (if continuing in the same Persuasion) should make some Reply to those Contradictions. In order whereunto,

I begin with the ingenious Author of the *Republique des Lettres*, who saith that *Rey* in *Persia* is far bigger than *London*, for that in the 6th Century of Christianity (I suppose *An.* 550, the Middle of that Century) it had 15000, or rather 44000 Moschees, or *Mabometan* Temples; to which I reply, that I hope this Objector is but in Jest, for that *Mabomet* was not born till about the Year 570, and had no Moschees till about 50 Years after.

In the next Place I reply to the excellent Monsieur *Auzout's* Letters from *Rome*, who is content that *London*, *Westminster* and *Southwark*, may have as many People as *Paris* and its Suburbs ; and but faintly denieth, that all the Housing within the Bills, may have almost as many People as *Paris* and *Rouen*, but saith that several Parishes inserted into these Bills, are distant from, and not contiguous with *London*, and that *Grant* so understood it.

To

To which (as his main if not his only Objection) we answer : 1. That the *London Bills* appear in *Grant's Book*, to have been always since the Year 1636, as they now are. 2. That about 50 Years since, three or 4 Parishes, formerly somewhat distant, were joined by interposed Buildings, to the Bulk of the City, and therefore then inserted into the Bills. 3. That since 50 Years, the whole Buildings being more than double, have perfected that Union, so as there is no House within the said Bills, from which one may not call to some other House. 4. All this is confirmed by Authority of the King and City, and the Custom of 50 Years. 5. That there are but 3 Parishes under any Colour of this Exception, which are scarce 1/2 Part of the Whole.

Upon the whole Matter, upon the Sight of Monsieur *Auxout's* large Letter, dated the 19th of *November*, from *Rome*, I made Remarks upon every Paragraph thereof; but suppressing it (because it look'd like a War against a worthy Person, with whom I intended none, whereas in Truth it was but a reconciling Explication of some Doubts) I have chosen the shorter and softer Way of answering Monsieur *Auxout* as followeth, *viz.*

Concerning the Number of People in London, as also in Paris, Rouen, and Rome, viz.

Monfieur *Auzout* alledgeth an authentick Account, that there are 23223 Houfes in *Paris*, wherein do live about 80 Thoufand Families, and therefore fupposing 3 Families, to live in every of the faid Houfes; one with another, the Number of Families will be 81280; and Monfieur *Auzout* alfo allowing 6 Heads to each Family, the utmoft Number of People in *Paris* according to that Opinion will be 487,680

The Medium of the *Paris* Burials was not denied by Monfieur *Auzout* to be 19887, nor that there died 3506 unneceffarily out of *L'Hotel Dieu*; wherefore deducting the faid laft Number out of the former, the neat Standard for Burials at *Paris*, will be 16381, fo as the Number of People there, allowing but one to die out of 30 (which is more advantageous to *Paris* than Monfieur *Auzout's* Opinion of one to die out of 25) the Number of People at *Paris* will be 491,430, more than by Monfieur *Auzout's* own laft mentioned Account.

And

And the Medium of the said two
Paris Accompts is } 488, 055

The Medium of the *London* Bu-
rials is really 23212, which multi-
plied by 30 (as hath been done for
Paris) the Number of the People
there will be } 696, 360

The Number of Houses at *London*
appears by the Register to be 105,315,
whereunto adding ¹⁰ Part of the same,
or 10331, as the least Number of
double Families that can be supposed
in *London*, the Total of Families will
be 115,840; and allowing 6 Heads
for each Family as was done for *Pa-
ris*, the Total of the People at *Lon-
don* will be } 695, 076

The Medium of the two last *Lon-
don* Accounts is } 695, 718

So as the People of *Pa-
ris* according to the above } 488, 055
Account is

Of *Rouen* according to
Monsieur *Auzout's* ut- } 80, 000 } 693, 055
most Demands

Of *Rome* according to
his own Report thereof in } 125, 000 }
a former Letter

So as there are more People at
London than at *Paris*, *Rouen*, and } 2, 663
Rome

Memorandum, That the Parishes of *Iffington*, *Newington*, and *Hackney*, for which only there is any Colour of Non-contiguity, is not $\frac{1}{2}$ Part of what is contained in the Bills of Mortality, and consequently *London*, without the said 3 Parishes, hath more People than *Paris* and *Rouen* put together by

114, 284

Which Number of 114,284 is probably more People than any other City of *France* contains.

The S E C O N D E S S A Y.

AS for other Comparisons of *London* with *Paris*, we farther repeat and enlarge what hath been formerly said upon those Matters, as followeth, *viz.*

1. That 40 *per Cent.* die out of the Hospitals at *Paris* where so many die unnecessarily, and scarce $\frac{1}{20}$ of that Proportion out of the Hospitals of *London*, which have been shewn to be better than the best of *Paris*.

2. That at *Paris* 81280 Kitchens, are within less than 24000 Street-doors, which makes a less cleanly and convenient Way of living than at *London*.

3. Where the Number of Christenings are near unto, or exceed the Burials, the People are poorer, having few Servants and little Equipage.

F

4. The

4. The River of *Thames* is more pleasant and navigable than the *Seyne*, and its Waters better and more wholesome; and the Bridge of *London* is the most considerable of all *Europe*.

5. The Shipping and foreign Trade of *London* is incomparably greater than that at *Paris* and *Rouen*.

6. The Lawyers Chambers at *London* have 2772 Chimnies in them, and are worth 140 Thousand Pounds sterling, or 3 Millions of *French Livres*, besides the Dwellings of their Families elsewhere.

7. The Air is more wholesome, for that at *London* scarce 2 of 16 die out of the worst Hospitals, but at *Paris* above 2 of 15 out of the best. Moreover the Burials of *Paris* are 1/2 Part above and below the Medium, but at *London* not above 1/3, so as the Intemperies of the Air at *Paris* is far greater than at *London*.

8. The Fuel cheaper, and lies in less Room, the Coals being an wholesome sulphurous Bitumen.

9. All the most necessary Sorts of Victuals, and of Fish, are cheaper, and Drinks of all Sorts in greater Variety and Plenty.

10. The Churches of *London* we leave to be judg'd by thinking that nothing at *Paris* is so great as *St. Paul's* was, and is like to be, nor so beautiful as *Henry the Seventh's Chapel*.

11. On the other Hand, 'tis probable, that there is more Money in *Paris* than *London*, if the publick Revenue (grossly speaking, quadruple to that of *England*) be lodged there.

12. *Paris*

12. *Paris* hath not been for these last 50 Years so much infested with the Plague as *London*; now that at *London* the Plague (which between the Year 1591 and 1666, made 5 Returns, viz. every 15 Years at a Medium, and at each Time carried away $\frac{1}{3}$ of the People) hath not been known for the 21 Years last past, and there is a visible Way by God's ordinary Blessing to lessen the same by $\frac{2}{3}$ when it next appeareth.

13. As to the Ground upon which *Paris* stands in respect of *London*, we say, that if there be 5 Stories or Floors of Housing at *Paris*, for 4 at *London*, or in that Proportion, then the 82 Thousand Families at *Paris* stand upon the Equivalent of 65000 *London* Housteds, and if there be 115000 Families at *London*, and but 82000 at *Paris*, then the Proportion of the *London* Ground to that of *Paris* is as 115 to 65, or as 23 to 13.

14. Moreover *Paris* is said to be an Oval of 3 *English* Miles long and 2 $\frac{1}{2}$ broad, the Area whereof contains but 5 $\frac{1}{2}$ square Miles; but *London* is 7 Miles long, and $\frac{1}{4}$ broad at a Medium, which makes an Area of near 9 square Miles, which Proportion of 5 $\frac{1}{2}$ to 9 differs little from that of 13 to 23.

15. *Memorandum*, That in *Nero's* Time, as Monsieur *Chevreau* reporteth, there died 300 Thousand People of the Plague in Old *Rome*; now if there died 3 of 10 then, and there, being a hotter Country, as there dies 2 of 10 at *London*, the Number of People at that Time, was but a Million, whereas at *London* they are now about

700 Thousand. Moreover the Ground within the Walls of Old *Rome* was a Circle but of 3 Miles diameter, whose Area is about 7 square Miles, and the Suburbs scarce as much more, in all about 13 square Miles; whereas the built Ground at *London* is about 9 square Miles as aforesaid; which two Sorts of Proportions agree with each other, and consequently Old *Rome* seems but to have been half as big again as the present *London*, which we offer to Antiquaries.

The THIRD ESSAY.

PROOFS that the Number of People in the 134 Parishes of the *London* Bills of Mortality, without Reference to other Cities, is about 696 Thousand, *viz.*

I know but three Ways of finding the same.

1. By the Houses and Families, and Heads living in each.

2. By the Number of Burials in healthful Times, and by the Proportion of those that live, to those that die.

3. By the Number of those who die of the Plague in pestilential Years, in Proportion to those that escape.

The First Way.

To know the Number of Houses I used three Methods, *viz.*

1. The Number of Houses which were burnt *Anno* 1666, which by authentick Report was 13200; next what Proportion the People who died out of those Houses, bore to the Whole;

Whole ; which I find *Anno* 1686, to be but $\frac{2}{7}$ Part, but *Anno* 1666 to be almost $\frac{1}{2}$, from whence I infer the whole Housing of *London Anno* 1666 to have been 66 Thousand ; then finding the Burials *Anno* 1666 to be to those of 1686 as 3 to 4, I pitch upon 88 Thousand to be the Number of Houses *Anno* 1686.

2. Those who have been employed in making the general Map of *London*, set forth in the Year 1682, told me that in that Year they had found above 84 Thousand Houses to be in *London* ; wherefore *Anno* 1686, or in 4 Years more, there might be $\frac{1}{10}$ or 8400 Houses more (*London* doubling in 40 Years) so as the Whole, *Anno* 1686 might be 92400.

3. I found that *Anno* 1685, there were 29325 Hearths in *Dublin*, and 6400 Houses, and in *London* 388 Thousand Hearths, whereby there must have been at that Rate 87000 Houses in *London*. Moreover I found that in *Bristol* there were in the same Year 16752 Hearths, and 5307 Houses, and in *London* 388 Thousand Hearths as aforesaid ; at which Rate there must have been 123 Thousand Houses in *London*, and at a Medium between *Dublin* and *Bristol* Proportions, 105 Thousand Houses.

Lastly, by Certificate from the Hearth-Office, I find the Houses within the Bills of Mortality to be 105,315.

Having thus found the Houses, I proceed next to the Number of Families in them ; and first I thought that if there were 3 or 4 Families or

Kitchins in every House of *Paris*, there might be 2 Families in $\frac{1}{10}$ of the Housing of *London*; unto which Supposition, the common Opinion of several Friends, doth concur with my own Conjectures.

As to the Number of Heads in each Family, I stick to *Grant's* Observation in his fifth Edition, that in Tradesmen of *London's* Families, there be 8 Heads one with another, in Families of higher Ranks, above 10, and in poorest near 5, according to which Proportions, I had upon another Occasion pitch'd the Medium of Heads in all the Families of *England* to be $6\frac{1}{3}$, but quitting the Fraction in this Case, I agree with Monsieur *Auzout* for 6.

To conclude, the Houses of *London* being 105315, and the Addition of double Families 10531 more, in all 115846; I multiplied the same by 6, which produced 695076 for the Number of the People.

The Second Way.

I found that the Years 1684 and 1685, being next each other, and both healthful, did wonderfully agree in their Burials, *viz.* 1684 they were 23202, and *Anno* 1685 23222, the Medium whereof is 23212; moreover that the Christenings 1684 were 14702, and those *Anno* 1685 were 14730; wherefore I multiplied the Medium of Burials 23212 by 30, supposing that one dies out of 30 at *London*, which made the Number of People 696360 Souls.

Now

Now to prove that one dies out of 30 at *London*, or thereabouts, I say,

1. That *Grant* in his fifth Edition, affirmeth from Observation, that 3 died of 88 *per Annum*, which is near the same Proportion.

2. I found that out of healthful Places, and out of adult Persons, there dies much fewer, as but 1 out of 50 among our Parliament Men, and that the Kings of *England* having reigned 24 Years one with another, probably lived above 30 Years each.

3. *Grant* hath shewn that but about 1 of 20 die *per An.* out of young Children under 10 Years old, and Monsieur *Auzout* thinks that but 1 of 40 die at *Rome*, out of the greater Proportion of adult Persons there; wherefore we still stick at a Medium to the Number 30.

4. In 9 Country Parishes lying in several Parts of *England*, I find that but 1 of 37 hath died *per An.* or 311 out of 11507, wherefore till I see another round Number, grounded upon many Observations, nearer than 30, I hope to have done pretty well in multiplying our Burials by 30, to find the Number of the People, the Product being 696360, and what we find by the Families they are 695,076, as aforesaid.

The Third Way,

It was proved by *Grant*, that $\frac{1}{30}$ of the People died of the Plague, but *Anno* 1665 there died of the Plague near 98 Thousand Persons, the

Quin-

Quintuple whereof is 490 Thousand, as the Number of People in the Year 1665, whereunto adding above $\frac{1}{3}$, as the Increase between 1665 and 1686, the Total is 653 Thousand, agreeing well enough with the other two Computations above-mentioned.

Wherefore let the Proportion of 1 to 30 continue till a better be put in its Place.

Memorandum, That 2 or 3 Hundred new Houses would make a Contiguity of 2 or 3 other great Parishes, with the 134 already mentioned in the Bills of Mortality; and that an oval Wall of about 20 Miles in Compass would enclose the same, and all the Shipping at *Deptford* and *Black-wall*, and would also fence in 20 Thousand Acres of Land, and lay the Foundation or Designation of several vast Advantages to the Owners, and Inhabitants of that Ground, as also to the whole Nation and Government.

The FOURTH ESSAY.

Concerning the Proportions of People in the 8 eminent Cities of Christendom undernamed, viz.

I. **W**E have by the Number of Burials in healthful Years, and by the Proportion of the living to those who die yearly, as also by the Number of Houses and Families within the 134 Parishes, called *London*, and the Estimate

Estimate of the Heads in each, pitch'd upon the Number of People in that City to be at a Medium 695718.

2. We have, by allowing that at *Paris* above 80 Thousand Families (*viz.* 81280) do live in 23223 Houses, 32 Palaces, and 38 Colleges, or that there are 81280 Kitchens within less than 24 Thousand Street-doors; as also by allowing 30 Heads for every one that died necessarily there; we have pitch'd upon the Number of People there at a Medium to be 488055, nor have we restrained them to 300 Thousand, by allowing with Monsieur *Auzout* 6 Heads for each of *Morery's* 50000 Houses or Families.

3. To *Amsterdam* we allow 187350 Souls, *viz.* 30 Times the Number of their Burials, which were 6245 in the Year 1685.

4. To *Venice* we allow 134 Thousand Souls, as found there in a special Account taken by Authority, about 10 Years since, when the City abounded with such as returned from *Candia*, then surrendered to the *Turks*.

5. To *Rome* we allow 119 Thousand Christians and 6000 Jews, in all 125 Thousand Souls, according to an Account sent hither of the same by Monsieur *Auzout*.

6. To *Dublin* we allow (as to *Amsterdam*) 30 Times its Burials, the Medium whereof for the last 2 Years is 2303, *viz.* 69090 Souls.

7. As to *Bristol*, we say that if the 6400 Houses of *Dublin* give 69,090 People, that the 5307 Houses of *Bristol*, must give above 56
Thousand

Thousand People; moreover, if the 29,325 Hearths of *Dublin*, give 69,090 People, the 16,752 Hearths of *Bristol*, must give about 40 Thousand; but the Medium of 56 Thousand and 40 Thousand is 48 Thousand.

8. As for *Rouen*, we have no Help, but Monsieur *Auzout's* Fancy of 80 Thousand Souls to be in that City, and the Conjecture of knowing Men, that *Rouen* is between the $\frac{1}{7}$ and $\frac{1}{8}$ Part of *Paris*, and also that it is by a Third bigger than *Bristol*: By all which, we estimate (till farther Light) that *Rouen* hath at most but 66 Thousand People in it,

Now it may be wondered why we mentioned *Rouen* at all, having had so little Knowledge of it; whereunto we answer, that we did not think it just to compare *London* with *Paris*, as to Shipping and foreign Trade, without adding *Rouen* thereunto, *Rouen* being to *Paris* as that Part of *London* which is below the Bridge, is to what is above it.

All which we heartily submit to the Correction of the Curious and Candid, in the mean Time observing according to the gross Numbers under-mentioned.

	<i>m.</i>
<i>London</i>	696
<i>Paris</i>	488
<i>Amsterdam</i>	187
<i>Venice</i>	134
<i>Rome</i>	125
<i>Dublin</i>	69
<i>Bristol</i>	48
<i>Rouen</i>	66

Ob-

<i>Observations on the said 8 Cities.</i>		<i>m.</i>
1. That the People of <i>Paris</i> being		488
	of <i>Rome</i>	125
	of <i>Rouen</i>	66

do make in all but 679
Thousand, or 17 Thousand less than the 696
Thousand of *London* alone.

2. That the People of the 2 *English* Cities
and Emporiums, viz. of *London* 696 Thousand,
and *Bristol* 48 Thousand, do make 744 Thou-
sand, or more than

	<i>m.</i>
In <i>Paris</i>	488
<i>Amsterdam</i>	187
<i>Rouen</i>	66

being in all 741 Thousand

3. That the same 2 *English* Cities seem equi-
valent

To <i>Paris</i> which hath	488 Thousand Souls.
To <i>Rouen</i>	66
To <i>Lyons</i>	100
To <i>Toulouse</i>	90

In all 744 Thousand

If there be any Error in these Conjectures
concerning these Cities of *France*, we hope
they will be mended by those whom we hear
to be now at work upon that Matter.

4. That the King of *England's* 3 Cities, viz.

Lon-

	<i>m.</i>		<i>m.</i>	
<i>London</i>	696	} exceed }	<i>Paris</i>	488
<i>Dublin</i>	69		<i>Amsterdam</i>	187
<i>Bristol</i>	48		<i>Venice</i>	134

In all 813 being but 809

5. That of the 4 great Emporiumis, *London*, *Amsterdam*, *Venice* and *Rouen*, *London* alone is near double to the other 3, viz. above 7 to 4.

London 696

6. That *London* (for aught appears) is the greatest and most considerable City of the World, but manifestly the greatest Emporium.

When these Assertions have past the *Examen* of the Critics, we shall make another *Essay*, shewing how to apply those Truths to the Honour and Profit of the King and Kingdom of *England*.

The FIFTH ESSAY.

Concerning Holland, and the rest of the United Provinces.

SINCE the Close of this Paper, it hath been objected from *Holland*, that what hath been said of the Number of Houses and People in *London*

London is not like to be true; for that if it were, then *London* would be $\frac{2}{3}$ of the whole Province of *Holland*. To which is answered, that *London* is the $\frac{2}{3}$ of all *Holland* and more, that Province having not a Million and 44000 Inhabitants (whereof 696 m. is the $\frac{2}{3}$) nor above 800 Thousand, as we have credibly and often heard; for suppose *Amsterdam* hath, as we have elsewhere noted, 187000, the seven next great Cities at 30000 each one with another 210000, the 10 next at 15000 each 150000, the 10 smallest at 6000 each 60000, in all the 28 walled Cities and Towns of *Holland* 607000, in the Dorps and Villages 193000, which is about one Head for every 4 Acres of Land; whereas in *England* there is 8 Acres for every Head, without the Cities and Market Towns.

Now suppose *London* having 116000 Families, should have 7 Heads in each, the Medium between Monsieur *Auzout* and *Grant*'s Reckonings, the Total of the People would be 812000, or if we reckon that there dies 1 out of 34 (the Medium between 30 and 37 above-mentioned) the Total of the People would be 34 Times 23212, viz. 789208, the Medium between which Number, and the above 812 Thousand, is 800604, somewhat exceeding 800 Thousand, the supposed Number of *Holland*.

Farthermore, I say that upon former Searches into the Peopling of the World, I never found that in any Country (not in *China* itself) there was more than one Man to every *English* Acre
of

of Land (many Territories passing for well peopled, where there is but one Man for ten such Acres) I found by measuring *Holland* and *West-Frisia*, alias *North-Holland*, upon the best Maps, that it contained but as many such Acres as *London* doth of People, viz. about 696000 Acres; I therefore venture to pronounce (till better informed) that the People of *London* are as many as those of *Holland*, or at least above $\frac{2}{3}$ of the same; which is enough to disable the Objection above-mentioned; nor is there any Need to strain up *London* from 696000 to 800000, tho' competent Reasons have been given to that Purpose, and though the Author of the excellent Map of *London*, set forth *Anno* 1682, reckoned the People thereof (as by the said Map appears) to be 1200,000, even when he thought the Houses of the same to be but 85000.

The worthy Person who makes this Objection in the same Letter also saith,

1. That the Province of *Holland*, hath as many People as the other 6 United Provinces together, and as the whole Kingdom of *England*, and double to the City of *Paris* and its Suburbs; that is to say, 2 Millions of Souls. 2. He says that in *London* and *Amsterdam*, and other trading Cities there are 10 Heads to every Family, and that in *Amsterdam* there are not 2200 Families. 3. He excepteth against the Register alledged by Monsieur *Auzoyt*, which makes 23223 Houses, and above 80,000 Families to be in *Paris*, as also against the Register alledged by *Petty*, making 105315 Houses to be in *London*,

don, with a tenth Part of the same to be of Families more than Houses, and probably will except against the Register of 1163000 Houses to be in all *England*, that Number giving at 6 Heads to each Family, about 7 Millions of People; upon all which we remark as followeth, *viz.*

1. That if *Paris* doth contain but 488 thousand Souls, that then all *Holland* containeth but the Double of that Number, or 976 Thousand; wherefore *London* (containing 696 Thousand Souls, hath above $\frac{2}{3}$ of all *Holland* by 46000.

2. If *Paris* containeth half as many People as there are in all *England*, it must contain 3 Millions and a half of Souls, or above 7 Times 488 Thousand, and because there do not die 20 Thousand *per An.* out of *Paris*, there must die but one out of 175, whereas Monsieur *Auzout* thinks that there dies 1 out of 25, and there must live 149 Heads in every House of *Paris* mentioned in the Register, but there must be scarce 2 Heads in every House of *England*; all which we think fit to be reconsidered.

I must as an *Englisman* take Notice of one Point more, which is, that these Assertions do reflect upon the Empire of *England*; for that it is said, that *England* hath but two Millions of Inhabitants, and it might as well have been added, that *Scotland* and *Ireland*, with the Islands of *Man*, *Ferfey* and *Guernsey* have but $\frac{2}{3}$ of the same Number, or 800 Thousand more, or that all the King of *England*'s Subjects in *Europe* are but two Millions and 800 Thousand Souls; whereas he saith, that the Subjects of the 7 United

nited Provinces are four Millions. To which we answer, that the Subjects of the said 7 Provinces, are by this Objector's own shewing, but the Quadruple of *Paris*, or 1932 Thousand Souls, *Paris* containing but 488000 as afore hath been prov'd, and we do here affirm that *England* hath 7 Millions of People, and that *Scotland, Ireland*, with the Islands of *Man, Jersey* and *Guernsey*, hath $\frac{2}{3}$ of the said Number, or two Millions 800 Thousand more, in all 9 Millions 800 Thousand; whereas by the Objector's Doctrine, if the 7 Provinces have 1932 Thousand People, the King of *England's* Territories should have but $\frac{7}{10}$ of the same Number, viz. 1351 Thousand; whereas we say 9800 Thousand, as aforesaid, which Difference is so gross as that it deserves to be thus reflected upon.

To conclude, we expect from the concerned Critics of the World, that they would prove,

1. That *Holland* and *West-Frizia*, and the 28 Towns and Cities thereof, hath more People than *London* alone.

2. That any 3 the best Cities of *France*, any 2 of all Christendom, or any 1 of the World, hath the same, or better Housing, and more foreign Trade than *London*, even in the Year that King *James II.* came to the Empire thereof.

POLITICAL ARITHMETICK,

O R A

DISCOURSE

Concerning

The Extent and Value of Lands, People, Buildings; Husbandry, Manufactures, Commerce, Fishery, Artizans, Seamen, Soldiers; Publick Revenues, Interest, Taxes, Superlucration, Registries, Banks; Valuation of Men, Increasing of Seamen, of Militia's, Harbours, Situation, Shipping, Power at Sea, &c. As the same relates to every Country in general, but more particularly to the Territories of his Majesty of *Great Britain*, and his Neighbours of *Holland*, *Zealand*, and *France*.

By Sir WILLIAM PETTY, *late Fellow of the Royal Society.*

1691.

G

LET this Book called *Political Arith-*
metick, which was long since wrote
by Sir *William Petty* deceased, be Printed.

*Given at the Court at Whitehall the 7th Day of
November, 1690.*

Nottingham.

T O T H E
K I N G ' S

Most Excellent MAJESTY.

S I R,

WHILST every one meditates some fit Offering for your Majesty, such as may best agree with your happy Exaltation to this Throne ; I presume to offer, what my Father long since wrote, to shew the Weight and Importance of the *English* Crown.

It was by him stiled *Political Arithmetick*, inasmuch as Things of Government, and of no less Concern and Extent, than the Glory of the Prince, and the Happiness and Greatness of the People, are, by the ordinary Rules of Arithmetick, brought into a Sort of Demonstration. He was allowed by all, to be the Inventor of this Method of Instruction ; where the perplexed and intricate Ways of the World, are explained by a very mean Piece of Science ; and had not the Doctrines of this Essay

G 2 offended

offended *France*, they had long since seen the Light, and had found Followers, as well as Improvements before this Time, to the Advantage perhaps of Mankind.

But this has been reserved to the Felicity of your Majesty's Reign, and, to the Expectation which the Learned have therein; and if while in this, I do some Honour to the Memory of a good Father, I can also pay Service, and some Testimony of my Zeal and Reverence to so great a King, it will be the utmost Ambition of

S I R,

Your Majesty's most dutiful

and most obedient Subject;

SHEL BORN E.

P R E.

P R E F A C E.

FORASMUCH as Men, who are in a decaying Condition, or who have but an ill Opinion of their own Concernments, instead of being (as some think) the more industrious to resist the Evils they apprehend, do contrariwise become the more languid and ineffectual in all their Endeavours, neither caring to attempt or prosecute even the probable Means of their Relief. Upon this Consideration, as a Member of the Commonwealth, next to knowing the precise Truth in what Condition the common Interest stands, I would in all doubtful Cases think the best, and consequently not despair, without strong and manifest Reasons, carefully examining whatever tends to lessen my Hopes of the publick Welfare,

I have therefore thought-fit to examine the following Persuasions, which I find too current in the World, and too much to have affected the Minds of some, to the Prejudice of all, *viz.*

That the Rents of Lands are generally fallen; that therefore, and for many other Reasons, the

whole Kingdom grows every Day poorer and poorer; that formerly it abounded with Gold, but now there is a great Scarcity both of Gold and Silver; that there is no Trade nor Employment for the People, and yet that the Land is under-peopled; that Taxes have been many and great; that *Ireland* and the Plantations in *America*, and other Additions to the Crown, are a Burthen to *England*; that *Scotland* is of no Advantage; that Trade in general doth lamentably decay; that the *Hollanders* are at our Heels, in the Race of Naval Power; the *French* grow too fast upon both, and appear so rich and potent, that it is but their Clemency that they do not devour their Neighbours; and finally, that the Church and State of *England*, are in the same Danger with the Trade of *England*; with many other dismal Suggestions, which I had rather stifle than repeat.

'Tis true, the Expence of foreign Commodities hath of late been too great; much of our Plate, had it remain'd Money, would have better served Trade; too many Matters have been regulated by Laws, which Nature, long Custom, and general Consent, ought only to have governed; the Slaughter and Destruction of Men by the late Civil Wars and Plague have been great; the Fire at *London*, and Disaster at *Chatbam*, have begotten Opinions in the *Vulgus* of the World to our Prejudice; the Nonconformists increase; the People of *Ireland* think
long

long of their Settlement ; the *English* there apprehend themselves to be Aliens, and are forced to seek a Trade with Foreigners, which they might as well maintain with their own Relations in *England*. But notwithstanding all this, (the like whereof was always in all Places), the Buildings of *London* grow great and glorious ; the *American* Plantations employ four Hundred Sail of Ships ; Actions in the *East-India* Company are near double the principal Money ; those who can give good Security, may have Money under the Statute-Interest ; Materials for building, (even Oaken-Timber) are little the dearer, some cheaper for the rebuilding of *London* ; the Exchange seems as full of Merchants as formerly ; no more Beggars in the Streets, nor executed for Thieves, than heretofore ; the Number of Coaches, and Splendor of Equipage exceeding former Times ; the publick Theatres very magnificent : the King has a greater Navy, and stronger Guards than before our Calamities ; the Clergy rich, and the Cathedrals in Repair ; much Land has been improved, and the Price of Food so reasonable, as that Men refuse to have it cheaper, by admitting of *Irish* Cattle ; and in brief, no Man needs to want that will take moderate Pains. That some are poorer than others, ever was and ever will be : And that many are naturally querulous and envious, is an Evil as old as the World.

These general Observations, and that Men eat, and drink, and laugh as they use to do,

have encouraged me to try if I could also comfort others, being satisfied myself, that the Interest and Affairs of *England* are in no deplorable Condition.

The Method I take to do this, is not yet very usual; for instead of using only comparative and superlative Words, and intellectual Arguments, I have taken the Course (as a Specimen of the Political Arithmetick I have long aimed at) to express myself in Terms of *Number*, *Weight*, or *Measure*; to use only Arguments of Sense, and to consider only such Causes, as have visible Foundations in Nature; leaving those that depend upon the mutable Minds, Opinions, Appetites, and Passions of particular Men, to the Consideration of others; Really professing myself as unable to speak satisfactorily upon those Grounds (if they may be called Grounds,) as to foretell the Cast of a Dye; to play well at Tennis, Billiards, or Bowls, (without long Practice,) by Virtue of the most elaborate Conceptions that ever have been written *De Projectilibus & Missilibus*, or of the Angles of Incidence and Reflection.

Now the Observations or Positions expressed by *Number*, *Weight*, and *Measure*, upon which I bottom the ensuing Discourses, are either true, or not apparently false, and which if they are not already true, certain, and evident, yet may be made so by the Sovereign Power, *Nam id certum est quod certum reddi potest*, and if they are false, not so false as to destroy the Argument

ment they are brought for ; but at worst are sufficient as Suppositions to shew the Way to that Knowledge I aim at. And I have withal for the present confined myself to the ten principal Conclusions hereafter particularly handled, which if they shall be judged material, and worthy of a better Discussion, I hope all ingenious and candid Persons will rectify the Errors, Defects, and Imperfections, which probably may be found in any of the Positions, upon which these Ratiocinations were grounded. Nor would it misbecome Authority itself, to clear the Truth of those Matters which private Endeavours cannot reach to,

C H A P. I.

That a small Country and few People, by its Situation, Trade, and Policy, may be equivalent in Wealth and Strength, to a far greater People and Territory: And particularly that Conveniencies for Shipping and Water-Carriage, do most eminently and fundamentally conduce thereunto.

THE first principal Conclusion by Reason of its Length, I consider in three Parts; whereof the first is, That a small Country and few People, may be equivalent in Wealth and Strength to a far greater People and Territory.

This Part of the first principal Conclusion needs little Proof; forasmuch as one Acre of Land, may bear as much Corn and feed as many Cattle as Twenty, by the Difference of the Soil; some Parcel of Ground is naturally so defensible, as that an hundred Men being possessed thereof, can resist the Invasion of five Hundred; and bad Land may be improved and made good; Bog may by draining be made Meadow; Heath-land may (as in *Flanders*) be made to bear Flax and Clover-grass, so as to advance in Value from One to an Hundred; the same Land being built upon, may centuple the Rent which it yielded as Pasture; one Man is more nimble or strong, and more patient of Labour than another; one Man by Art may do

as much Work, as many without it; viz. one Man with a Mill can grind as much Corn, as Twenty can pound in a Mortar; one Printer can make as many Copies, as an hundred Men can write by Hand; one Horfe can carry upon Wheels, as much as Five upon their Backs; and in a Boat, or upon Ice, as Twenty: So that I say again, this first Point of this general Position, needs little or no Proof. But the second and more material Part of this Conclusion is, that this Difference in Land and People, arises principally from their Situation, Trade, and Policy.

To clear this, I shall compare *Holland* and *Zealand*, with the Kingdom of *France*; viz. *Holland* and *Zealand* do not contain above one Million of *English* Acres, whereas the Kingdom of *France* contains above 80.

Now the original and primitive Difference holds Proportion as Land to Land, for it is hard to say, that when these Places were first planted, whether an Acre in *France* was better than the like Quantity in *Holland* and *Zealand*; nor is there any Reason to suppose, but that therefore upon the first Plantation, the Number of Planters was in Proportion to the Quantity of Land; wherefore, if the People are not in the same Proportion as the Land, the same must be attributed to the Situation of the Land, and to the Trade and Policy of the People superstructed thereupon.

The next Thing to be shewn is, that *Holland* and *Zealand* at this Day, is not only an eightieth
Part

Part as rich and strong as *France*, but that it hath advanced to one Third or thereabouts, which I think will appear upon the Balance of the following Particulars, *viz.*

As to the Wealth of *France*, a certain Map of that Kingdom, set forth *Anno* 1647, represents it to be fifteen Millions, whereof six did belong to the Church, the Author thereof (as I suppose) meaning the Rents of the Lands only: And the Author of a most judicious Discourse of Husbandry (supposed to be Sir *Richard Weston*,) doth from Reason and Experience shew, that Lands in the Netherlands, by bearing Flax, Turneps, Clover-grass, Madder, &c. will easily yield 10 *l. per Acre*; so as the Territories of *Holland* and *Zealand*, should by his Account yield at least Ten Millions *per Annum*, yet I do not believe the same to be so much, nor *France* so little as above said, but rather, that one bears to the other as about 7, or 8 to 1.

The People of *Amsterdam*, are one Third of those in *Paris* or *London*, which two Cities differ not in People a twentieth Part from each other, as hath appeared by the Bills of Burials and Christenings for each: But the Value of the Buildings in *Amsterdam*, may well be half that of *Paris*, by Reason of the Foundations, Grafts, and Bridges, which in *Amsterdam* are more numerous and chargeable than at *Paris*. Moreover the Habitations of the poorest People in *Holland* and *Zealand*, are twice or thrice as good as those of *France*; but the People of the
one

one to the People of the other, being but as 13 to 1, the Value of the Houſing muſt be as about 5 to 1.

The Value of the Shipping of *Europe*, being about two Millions of Tons, I ſuppoſe the *Engliſh* have Five Hundred Thouſand, the *Dutch* Nine Hundred Thouſand, the *French* an Hundred Thouſand, the *Hamburgers*, and the Subjects of *Denmark*, *Sweden*, and the Town of *Dantzick* Two Hundred and Fifty Thouſand, and *Spain*, *Portugal*, *Italy*, &c. Two Hundred and Fifty Thouſand ; ſo as the Shipping in our Caſe of *France* to that of *Holland*, is about 1 to 9, which reckoned as great and ſmall, new and old, one with another at 8 *l. per Ton*, makes the Worth to be as Eight Hundred Thouſand Pounds, to Seven Millions and two Hundred Thouſand Pounds. The *Hollanders* Capital in the *East-India* Company, is worth above Three Millions, where the *French* as yet have little or nothing.

The Value of the Goods exported out of *France* into all Parts, are ſuppoſed Quadruple to what is ſent to *England* alone, and conſequently in all about Five Millions, but what is exported out of *Holland* into *England* is worth 2 Millions ; and what is exported thence into all the World beſides, is Sextuple to the ſame.

The Monies yearly raiſed by the King of *France*, as the ſame appears by the Book intituled *The State of France*, dedicated to the King, printed *Anno 1669*, and ſet forth ſeveral Times by Authority, is 82000000 of *French Livres*,
which

which is about 6 $\frac{1}{2}$ Millions of Pounds Sterling, of which Sum the Author says, that one fifth Part was abated for Non-valeurs or Insolvencies, so (as I suppose) not above Five Millions were effectually raised: But whereas some say, that the King of *France* raised Eleven Millions as the $\frac{1}{3}$ of the Effects of *France*; I humbly affirm, that all the Land and Sea Forces, all the Buildings and Entertainments, which we have heard by common Fame, to have been set forth and made in any of these seven last Years, need not to have cost six Millions Sterling; wherefore, I suppose he hath not raised more, especially since there were one fifth Insolvencies, when the Tax was at that Pitch. But *Holland* and *Zealand*, paying 67 of the 100, paid by all the United Provinces, and the City of *Amsterdam* paying 27 of the said 67; it follows that if *Amsterdam* hath paid 4000 *l.* Flemish *per Diem*, or about 1400000 *l.* *per Annum*, or 800000 *l.* Sterling; that all *Holland* and *Zealand* have paid 2100000 *l.* *per Annum*: Now the Reasons why I think they pay so much, are these, *viz.*

1. The Author of the State of the *Netberlands* saith so.

2. Excise of Victual at *Amsterdam*, seems above half the original Value of the same, *viz.*

Ground Corn pays 20 Stivers the Bushel, or 63 Guilders the Last; Beer 113 Stivers the Barrel, Housing $\frac{1}{3}$ of the Rent, Fruit $\frac{1}{3}$ of what it cost; other Commodities $\frac{1}{7}$, $\frac{1}{8}$, $\frac{1}{9}$, $\frac{1}{12}$; Salt *ad libitum*, all weighed Goods pay besides the Pre-
misses

misses a vast Sum ; now if the Expence of the People of *Amsterdam* at a Medium, and without Excise were 8 *l. per Annum*, whereas in *England* 'tis 7 *l.*, then if all the several Imposts above named, raise it Five Pound more, there being 160000 Souls in *Amsterdam*, the Sum of 800000 Pound Sterling *per Annum* will thereby be raised.

3. Though the Expence of each Head should be 13 *l. per Annum* ; 'tis well known that there be few in *Amsterdam*, who do not earn much more than the said Expence.

4. If *Holland* and *Zealand* pay *per Annum* 2100000 *l.* then all the Provinces together, must pay about 3000000 *l.* less than which Sum *per An.* perhaps is not sufficient to have maintained the Naval War with *England*, 72000 Land Forces, besides all other the ordinary Charges of their Government, whereof the Church is there a Part: To conclude, it seems from the Premises, that all *France* doth not raise above thrice as much from the publick Charge, as *Holland* and *Zealand* alone do.

5. Interest of Money in *France*, is 7 *l. per Cent.* but in *Holland* scarce half so much.

6. The Countries of *Holland* and *Zealand* consisting as it were of Islands guarded with the Sea, Shipping, and Marshes, is defensible at one Fourth of the Charge, that a plain open Country is, and where the Seat of War may be both Winter and Summer ; whereas in the others, little can be done but in the Summer only.

7. But

7. But above all the Particulars hitherto considered, that of Superlucration ought chiefly to be taken in ; for if a Prince have never so many Subjects, and his Country be never so good, yet if either through Sloth, or extravagant Expences, or Oppression and Injustice, whatever is gained shall be spent as fast as gotten, that State must be accounted poor ; wherefore let it be considered, how much, or how many Times rather, *Holland* and *Zealand* are now above what they were 100 Years ago, which we must also do of *France* : Now if *France* hath scarce doubled its Wealth and Power, and that the other have decupled theirs, I shall give the Preference to the latter, even although the $\frac{2}{10}$ increased by the one, should not exceed the one half gained by the other, because one has a Store for nine Years, the other but for one.

To conclude, upon the Whole it seems, that though *France* be in People to *Holland* and *Zealand* as 13 to 1, and in Quantity of good Land, as 80 to 1, yet is not 13 Times richer and stronger, much less 80 Times, nor much above thrice, which was to be proved.

Having thus dispatched the two first Branches of the first principal Conclusion, it follows, to shew that this Difference of Improvement in Wealth and Strength, arises from the Situation, Trade, and Policy of the Places respectively, and in particular from Conveniencies for Shipping and Water-Carriage.

Many

Many writing on this Subject do so magnify the *Hollanders* as if they were more, and all other Nations less than Men (as to the Matters of Trade and Policy) making them Angels, and others Fools, Brutes, and Sots, as to those Particulars ; whereas I take the Foundation of their Atchievements to lie originally in the Situation of the Country, whereby they do Things inimitable by others, and have Advantages whereof others are incapable.

First, The Soil of *Holland* and *Zealand* is low Land, rich and fertile ; whereby it is able to feed many Men, and so as that Men may live near each other, for their mutual Assistance in Trade. I say that a Thousand Acres, that can feed 1000 Souls, is better than 10000 Acres of no more Effect, for the following Reasons, *viz.*

1. Suppose some great Fabrick were in building by a Thousand Men, shall not much more Time be spared if they lived all upon a Thousand Acres, than if they were forced to live upon ten Times as large a Scope of Land.

2. The Charge of the Cure of their Souls, and the Ministry would be far greater in one Case than in the other ; as also of mutual Defence in Case of Invasion, and even of Thieves and Robbers : Moreover the Charge of the Administration of Justice would be much easier, where Witnesses and Parties may be easily summoned, Attendance less expensive, when Mens Actions would be better known, when Wrongs and Injuries could not be covered, as in thin peopled Places they are.

H

Lastly,

Laſtly, thoſe who live in ſolitary Places, muſt be their own Soldiers, Divines, Phyſicians, and Lawyers, and muſt have their Houſes ſtored with neceſſary Proviſions, (like a Ship going upon a long Voyage,) to the great Waſte, and needleſs Expence of ſuch Proviſions; the Value of this firſt Convenience to the *Dutch*, I reckon or eſtimate to be about 100000 *l. per An.*

2dly, *Holland* is a level Country, ſo as in any Part thereof a Windmill may be ſet up, and by its being moiſt and vaporous, there is always Wind ſtirring over it, by which Advantage the Labour of many Thouſand Hands is ſaved, forasmuch as a Mill made by one Man in half a Year, will do as much Labour, as four Men for five Years together. This Advantage is greater or leſs, where Employment or Eaſe of Labour is ſo; but in *Holland* 'tis eminently great, and the Worth of this Conveniency is near 150000 *l.*

3dly, There is much more to be gained by Manufacture than Huſbandry, and by Merchandize than Manufacture; but *Holland* and *Zealand*, being ſeated at the Mouths of three long great Rivers, and paſſing through rich Countries, do keep all the Inhabitants upon the Sides of thoſe Rivers but as Huſbandmen, whiſt themſelves are the Manufacturers of their Commodities, and do diſpenſe them into all Parts of the World, making Returns for the ſame, at what Prices almoſt they pleaſe themſelves; and in ſhort, they keep the Keys of Trade of thoſe Countries, through which the ſaid Rivers paſs; the

the Value of this third Conveniency, I suppose to be 200000 *l.*

4thly, In *Holland* and *Zealand*, there is scarce any Place of Work, or Business, one Mile distant from a navigable Water, and the Charge of Water-Carriage is generally but $\frac{1}{15}$, or $\frac{1}{20}$ Part of Land-Carriage; wherefore if there be as much Trade there as in *France*, then the *Hollanders* can out-sell the *French* $\frac{14}{15}$ of all the Expence, of all Travelling, Postage, and Carriage, whatsoever, which even in *England* I take to be 300000 Pounds *per Annum*, where the very Postage of Letters costs the People perhaps 50000 *l. per Annum*, though farmed at much less, and all other Labour of Horses, and Porters, at least six Times as much: The Value of this Conveniency I estimate to be above 300000 *l. per An.*

5. The Defensibleness of the Country, by Reason of its Situation in the Sea upon Islands, and in the Marshes, impassible Ground dyked and trenched, especially considering how that Place is aimed at for its Wealth; I say the Charge of defending that Country is easier than if it were a plain Champian, at least 200000 *l. per Annum.*

6. *Holland* is so considerable for keeping Ships in Harbour with small Expence of Men, and Ground Tackle, that it saves *per An.* 200000 *l.* of what must be spent in *France*. Now if all these natural Advantages do amount to above 1 Million *per Annum* Profits, and that the Trade of all *Europe*, nay of the whole World, with

which our *Europeans* do trade, is not above 45 Millions *per Annum*, and if $\frac{1}{50}$ of the Value be $\frac{1}{7}$ of the Profit, it is plain that the *Hollander* may command and govern the whole Trade.

7. Those who have their Situation thus towards the Sea, and abound with Fish at home, and having also the Command of Shipping, have by Consequence the Fishing Trade, whereof that of Herrings alone brings more yearly Profit to the *Hollanders* than the Trade of the *West-Indies* to *Spain*, or of the *East* to themselves, as many have affirmed, being as the same say, *viis & modis*, of above 3 Millions *per An.* Profit.

8. It is not to be doubted, but those who have the Trade of Shipping and Fishing, will secure themselves of the Trade of Timber for Ships, Boats, Masts, and Casks; of Hemp for Cordage, Sails, and Nets; of Salt; of Iron; as also of Pitch, Tar, Rosin, Brimstone, Oil, and Tallow, as necessary Appurtenances to Shipping and Fishing.

9. Those who predominate in Shipping and Fishing, have more Occasions than others to frequent all Parts of the World, and to observe what is wanting or redundant every where, and what each People can do, and what they desire, and consequently to be the Factors and Carriers for the whole World of Trade. Upon which Ground they bring all native Commodities to be manufactured at home, and carry the same back, even to that Country in which they grew; all which we see.

For,

For, do they not work the Sugars of the *West-Indies*? The Timber and Iron of the *Baltick*? The Hemp of *Russia*? The Lead, Tin, and Wool of *England*? The Quicksilver and Silk of *Italy*? The Yarns, and Dying Stuffs of *Turkey*, &c. To be short, in all the ancient States, and Empires, those who had the Shipping, had the Wealth, and if 2 *per Cent.* in the Price of Commodities, be perhaps 20 *per Cent.* in the Gain; it is manifest that they who can in 45 Millions, under-sell others by one Million, (upon Account of natural and intrinsick Advantages only) may easily have the Trade of the World without such angelical Wits and Judgments; as some attribute to the *Hollanders*.

Having thus done with their Situation, I come now to their Trade.

It is commonly seen, that each Country flourisheth in the Manufacture of its own native Commodities, *viz.* *England* for woollen Manufacture, *France* for Paper, *Luic-land* for Iron-Ware, *Portugal* for Confectures, *Italy* for Silks; upon which Principle it follows, that *Holland* and *Zealand* must flourish most in the Trade of Shipping, and so become Carriers and Factors of the whole World of Trade. Now the Advantages of the Shipping Trade are as followeth, *viz.*

Husbandmen, Seamen, Soldiers, Artizans, and Merchants, are the very Pillars of any Commonwealth; all the other great Professions do rise out of the Infirmities and Miscarriages of

these ; now the Seaman is three of these four. For every Seaman of Industry and Ingenuity, is not only a Navigator, but a Merchant, and also a Soldier ; not because he hath often Occasion to fight, and handle Arms ; but because he is familiarized with Hardship and Hazards, extending to Life and Limbs ; for Training and Drilling is a small Part of Soldiery, in respect of this last-mentioned Qualification ; the one being quickly and presently learned, the other not without many Years most painful Experience ; Wherefore to have the Occasion of abounding in Seamen, is a vast Conveniency.

2. The Husbandman of *England* earns but about 4*s.* *per* Week, but the Seamen have as good as 12*s.* in Wages, Victuals (and as it were Housing) with other Accommodations, so as a Seaman is in Effect three Husbandmen ; wherefore there is little Ploughing, and Sowing of Corn in *Holland* and *Zealand*, or breeding of young Cattle : But their Land is improved by building Houses, Ships, Engines, Dykes, Wharfs, Gardens of Pleasure, extraordinary Flowers and Fruits ; for Dairy and feeding of Cattle, for Rape, Flax, Madder, &c. The Foundations of several advantageous Manufactures.

3. Whereas the Employment of other Men is confined to their own Country, that of Seamen is free to the whole World ; so as where Trade may (as they call it) be dead here or there, now and then, it is certain that some where or other in the World, Trade is always quick enough,

nough, and Provisions are always plentiful, the Benefit whereof those who command the Shipping enjoy, and they only.

4. The great and ultimate Effect of Trade is not Wealth at large, but particularly Abundance of Silver, Gold, and Jewels, which are not perishable, nor so mutable as other Commodities, but are Wealth at all Times, and all Places: Whereas Abundance of Wine, Corn, Fowls, Flesh, &c. are Riches but *hic & nunc*, so as the raising of such Commodities, and the following of such Trade, which does store the Country with Gold, Silver, Jewels, &c. is profitable before others. But the Labour of Seamen, and Freight of Ships, is always of the Nature of an exported Commodity, the Overplus whereof, above what is imported, brings home Money, &c.

5. Those who have the Command of the Sea Trade, may work at easier Freight with more Profit, than others at greater, for as Cloth must be cheaper made, when one cards, another spins, another weaves, another draws, another dresses, another presses and packs; than when all the Operations abovementioned, were clumsily performed by the same Hand; so those who command the Trade of Shipping, can build long slight Ships for carrying Masts, Fir-Timber, Boards, Balks, &c. and short ones for Lead, Iron, Stones, &c. One Sort of Vessels to trade at Ports where they need never lie a-ground, others where they must jump upon the

Sand twice every 12 Hours; one Sort of Vessels, and Way of manning in Time of Peace, and for cheap gross Goods, another for War and precious Commodities; one Sort of Vessels for the turbulent Sea, another for Inland Waters and Rivers; one Sort of Vessels and Rigging, where Haste is requisite for the Maidenhead of a Market, another where $\frac{3}{4}$ or $\frac{1}{4}$ Part of the Time makes no Matter. One Sort of Mastng and Rigging for long Voyages, another for Coasting. One Sort of Vessels for Fishing, another for Trade. One Sort for War for this or that Country, another for Burthen only. Some for Oars, some for Poles, some for Sails, and some for Draught by Men or Horses, some for the Northern Navigations amongst Ice, and some for the South against Worms, &c. And this I take to be the chief of several Reasons, why the *Hollanders* can go at less Freight than their Neighbours, *viz.* because they can afford a particular Sort of Vessels for each particular Trade.

I have shewn how Situation hath given them Shipping, and how Shipping hath given them in Effect all other Trade, and how foreign Traffick must give them as much Manufacture as they can manage themselves, and as for the Overplus make the rest of the World but as Workmen to their Shops. It now remains to shew the Effects of their Policy, superstructed upon these natural Advantages, and not as some think upon the Excess of their Understandings.

I have

I have omitted to mention that the *Hollanders* were one hundred Years since, a poor and oppressed People, living in a Country naturally cold, moist, and unpleasant; and were withal persecuted for their Heterodoxy in Religion.

From hence it necessarily follows, that this People must labour hard, and set all Hands to work: Rich and Poor, Young and Old, must study the Art of Number, Weight, and Measure; must fare hard, provide for Impotents, and for Orphans, out of Hope to make Profit by their Labours; must punish the Lazy by Labour, and not by cripling them: I say, all these Particulars, said to be the subtile Excogitations of the *Hollanders*, seem to me but what could not almost have been otherwise.

Liberty of Conscience, Registry of Conveyances, small Customs, Banks, Lumbards, and Law Merchant, rise all from the same Spring, and tend to the same Sea; as for Lowness of Interest, it is also a necessary Effect of all the Premises, and not the Fruit of their Contrivance.

Wherefore we shall only shew in particular the Efficacy of each, and first of Liberty of Conscience; but before I enter upon these, I shall mention a Practice almost forgotten (whether it referreth to Trade or Policy is not material,) which is, the *Hollanders* under-masting and sailing such of their Shipping, as carry cheap and gross Goods, and whose Sale doth not depend much upon Season.

It

It is to be noted, that of two equal and like Vessels, if one spreads 1600 Yards of like Canvase, and the other 2500, their Speed is but as four to five, so as one brings home the same Timber in four Days, as the other will in five. Now if we consider that although those Ships be but four or five Days under Sail, that they are perhaps thirty upon the Voyage; so as the one is but $\frac{1}{30}$ Part longer upon the whole Voyage than the other, though $\frac{1}{3}$ longer under Sail. Now if Masts, Yards, Rigging, Cables, and Anchors, do all depend upon the Quantity and Extent of the Sails, and consequently Hands also; it follows that the one Vessel goes at one third less Charge, losing but one thirtieth of the Time, and of what depends thereupon.

I now come to the first Policy of the *Dutch*, viz. Liberty of Conscience; which I conceive they grant upon these Grounds, (But keeping up always a Force to maintain the Common Peace,) 1. They themselves broke with *Spain*, to avoid the Imposition of the Clergy. 2. Dissenters of this Kind, are for the most Part, thinking, sober, and patient Men. and such as believe that Labour and Industry is their Duty towards God. (How erroneous soever their Opinions be.) 3. These People believing the Justice of God, and seeing the most licentious Persons to enjoy most of the World, and its best Things, will never venture to be of the same Religion and Profession with Voluptuaries, and Men of extreme Wealth and Power, who they think have their Portion in this World.

4. They

4. They cannot but know, that no Man can believe what himself pleases, and to force Men to say they believe what they do not, is vain, absurd, and without Honour to God.

5. The *Hollanders* knowing themselves not to be an infallible Church, and that others had the same Scripture for Guides as themselves, and withal the same Interest to save their Souls, did not think fit to make this Matter their Business; not more than to take Bonds of the Seamen they employ, not to cast away their own Ships and Lives.

6. The *Hollanders* observe that in *France* and *Spain*, (especially the latter) the Churchmen are about one hundred to one, to what they use or need; the principal Care of whom is to preserve Uniformity, and this they take to be a superfluous Charge.

7. They observe where most Endeavours have been used to keep Uniformity, there Heterodoxy hath most abounded.

8. They believe that if $\frac{1}{4}$ of the People were heterodox, and that if that whole Quarter should by Miracle be removed, that within a small Time one Quarter of the Remainder would again become heterodox some Way or other, it being natural for Men to differ in Opinion in Matters above Sense and Reason; and for those who have less Wealth, to think they have the more Wit and Understanding, especially of the Things of God, which they think chiefly belong to the Poor.

9. They

9. They think the Case of the primitive Christians, as it is represented in the *Acts of the Apostles*, looks like that of the present Dissenters, (I mean externally.) Moreover it is to be observed that Trade doth not (as some think) best flourish under popular Governments, but rather that Trade is most vigorously carried on, in every State and Government, by the heterodox Part of the same, and such as profess Opinions different from what are publickly established: (that is to say) in *India* where the *Mabometan* Religion is authorized, there the *Banians* are the most considerable Merchants. In the *Turkish* Empire the *Jews* and Christians: At *Venice*, *Naples*, *Leghorn*, *Genoa*, and *Lisbon*, *Jews*, and Non-Papist Merchant-Strangers: But to be short, in that Part of *Europe*, where the Roman Catholick Religion now hath, or lately hath had Establishment, there three Quarters of the whole Trade is in the Hands of such as have separated from that Church (that is to say) the Inhabitants of *England*, *Scotland*, and *Ireland*, as also those of the *United Provinces*, with *Denmark*, *Sweden*, and *Norway*, together with the Subjects of the *German* Protestant Princes, and the *Hans* Towns, do at this Day possess three Quarters of the Trade of the World; and even in *France* itself, the *Hugonots* are proportionably far the greatest Traders; nor is it to be denied but that in *Ireland*, where the said *Roman* Religion is not authorized, there the Professors thereof have a great Part of the Trade.

From

From whence it follows that Trade is not fixt to any Species of Religion as such; but rather as before hath been said to the heterodox Part of the whole, the Truth whereof appears also in all the particular Towns of greatest Trade in *England*; nor do I find Reason to believe, that the *Roman* Catholick Seamen in the whole World, are sufficient to man effectually a Fleet equal to what the King of *England* now hath; but the Non-papist Seamen can do above thrice as much. Wherefore he whom this latter Party doth affectionately own to be their Head, cannot probably be wronged in his Sea-concernments by the other; from whence it follows, that for the Advancement of Trade, (if that be a sufficient Reason) Indulgence must be granted in Matters of Opinion; though licentious Actings as even in *Holland*, be restrained by Force.

The second Policy or Help to Trade used by the *Hollanders*, is securing the Titles to Lands and Houses; for although Lands and Houses may be called *Terra firma & res immobilis*, yet the Title unto them is no more certain than it pleases the Lawyers and Authority to make them; wherefore the *Hollanders* do by Registries, and other Ways of Assurance, make the Title as immoveable as the Lands, for there can be no Encouragement to Industry, where there is no Assurance of what shall be gotten by it; and where by Fraud and Corruption, one Man may take away with Ease and by a Trick,
and

and in a Moment what another has gotten by many Years extreme Labour and Pains.

There hath been much Discourse about introducing of Registries into *England*; the Lawyers for the most Part object against it, alledging that Titles of Land in *England* are sufficiently secure already; wherefore omitting the Considerations of small and oblique Reasons *pro & contra*, it were good that Enquiry were made from the Officers of several Courts, to what Sum or Value Purchasers have been damnified for this last ten Years, by such fraudulent Conveyances as Registries would have prevented; the tenth Part whereof at a Medium, is the annual Loss which the People sustain for Want of them, and then Computation is to be made of the annual Charge of registering such extraordinary Conveyances, as would secure the Title of Lands; now by comparing these two Sums, the Question so much agitated may be determined; though some think that though few are actually damnified, yet that all are hindered by Fear and deterred from dealing.

Their third Policy is their Bank, the Use whereof is to encrease Money, or rather to make a small Sum equivalent in Trade to a greater, for the effecting whereof these Things are to be considered, 1. How much Money will drive the Trade of the Nation. 2. How much current Money there is actually in the Nation. 3. How much Money will serve to make all Payments of under 50*l.* or any other more convenient Sum through-

throughout the Year. 4. For what Sum the Keepers of the Bank are unquestionable Security : If all these four Particulars be well known, then it may also be known, how much of the ready Money above-mentioned may safely and profitably be lodged in the Bank, and to how much ready current Money the said deposited Money is equivalent. As for Example, suppose a Hundred Thousand Pounds will drive the Trade of the Nation, and suppose there be but sixty Thousand Pounds of ready Money in the same ; suppose also that Twenty Thous. Pounds will drive on and answer all Payments made of under 50 *l.* In this Case Forty of the Sixty being put into the Bank, will be equivalent to Eighty, which Eighty and Twenty kept out of the Bank do make up an Hundred, (that is to say) enough to drive the Trade as was proposed: Where note that the Bank-keepers must be responsible for double the Sum intrusted with them, and must have Power to levy upon the general, what they happen to lose unto particular Men.

Upon which Grounds the Bank may freely make use of the received Forty Thousand Pounds, whereby the said Sum, with the like Sum in Credit, makes Eighty Thousand Pounds, and with the Twenty reserved an Hundred.

I might here add many more Particulars, but being the same as have already been noted by others, I shall conclude only with adding one Observation which I take to be of Consequence,
viz.

viz. That the *Hollanders* do rid their Hands of two Trades, which are of greatest Turmoil and Danger, and yet of least Profit ; the first whereof is that of a common and private Soldier, for such they can hire from *England, Scotland, and Germany*, to venture their Lives for Sixpence a Day, whilst themselves safely and quietly follow such Trades, whereby the meanest of them gain six Times as much, and withal by this Entertaining of Strangers for Soldiers, their Country becomes more and more peopled, forasmuch as the Children of such Strangers are *Hollanders*, and take to Trades, whilst new Strangers are admitted *ad infinitum* ; besides these Soldiers at convenient Intervals, do at least as much Work as is equivalent to what they spend, and consequently by this Way of employing of Strangers for Soldiers, they people the Country, and save their own Persons from Danger and Misery, without any real Expence, effecting by this Method, what others have in vain attempted by Laws for naturalizing of Strangers, as if Men could be charmed to transplant themselves from their own native into a foreign Country, merely by Words, and for the bare Leave of being called by a new Name. In *Ireland* Laws of Naturalization have had little Effect, to bring in Aliens, and 'tis no Wonder, since *Englishmen* will not go thither, without they may have the Pay of Soldiers, or some other Advantage amounting to Maintenance.

Having

Having intimated the Way by which the *Hollanders* do increase their People, I shall here digress to set down the Way of computing the Value of every Head one with another, and that by the Instance of People in *England*, viz. Suppose the People of *England* be Six Millions in Number, that their Expence at 7 *l.* per Head be Forty-two Millions; Suppose also that the Rent of the Lands be Eight Millions, and the yearly Profit of all the Personal Estate be Eight Millions more; it must needs follow, that the Labour of the People must have supplied the remaining Twenty-six Millions, the which multiplied by Twenty (the Mass of Mankind being worth twenty Years Purchase as well as Land) makes Five hundred and twenty Millions, as the Value of the whole People; which Number divided by six Millions, makes above 80 *l.* Sterling to be the Value of each Head of Man, Woman, and Child, and of adult Persons twice as much; from whence we may learn to compute the Loss we have sustained by the Plague, by the Slaughter of Men in War, and by the sending them abroad into the Service of foreign Princes. The other Trade of which the *Hollanders* have rid their Hands, is the old patriarchal Trade of being Cow-keepers, and in a great Measure of that which concerns Ploughing and Sowing of Corn, having put that Employment upon the *Danes* and *Polanders*; from whom they have their young Cattle and Corn. Now here we may take Notice, that as Trades

and curious Arts increase, so the Trade of Husbandry will decrease, or else the Wages of Husbandmen must rise, and consequently the Rents of Lands must fall.

For Proof whereof I dare affirm, that if all the Husbandmen of *England*, who now earn but 8 *d.* a Day, or thereabouts, could become Tradesmen and earn 16 *d.* a Day (which is no great Wages, 2 *s.* and 2 *s.* 6 *d.* being usually given) that then it would be the Advantage of *England* to throw up their Husbandry, and to make no Use of their Lands, but for Grass, Horses, Milch Cows, Gardens, and Orchards, &c. which if it be so, and if Trade and Manufacture have increased in *England* (that is to say) if a greater Part of the People apply themselves to those Faculties than there did heretofore, and if the Price of Corn be no greater now, than when Husbandmen were more numerous, and Tradesmen fewer; it follows from that single Reason (though others may be added) that the Rents of Land must fall: As for Example, suppose the Price of Wheat be 5 *s.* or 60 *d.* the Bushel; now if the Rent of the Land whereon it grows be the third Sheaf, then of the 60 *d.* 20 *d.* is for the Land, and 40 *d.* for the Husbandman; but if the Husbandman's Wages should rise one eighth Part, or from 8 *d.* to 9 *d.* *per Diem*, then the Husbandman's Share in the Bushel of Wheat rises from 40 *d.* to 45 *d.* And consequently the Rent of the Land must fall from 20 *d.* to 15 *d.* for we suppose the Price of the
the

the Wheat still remains the same: Especially since we cannot raise it, for if we did attempt it, Corn would be brought in to us, (as into *Holland*) from foreign Parts, where the State of Husbandry was not changed.

And thus I have done with the first principal Conclusion, that *A small Territory, and even a few People, may by Situation, Trade, and Policy, be made equivalent to a greater; and that Convenience for Shipping, and Water-carriage, do most eminently and fundamentally conduce thereunto.*

C H A P. II.

That some Kind of Taxes and Publick Levies, may rather increase than diminish the Wealth of the Kingdom.

IF the Money or other Effects, levied from the People by Way of *Tax*, were destroyed and annihilated; then 'tis clear, that such Levies would diminish the Commonwealth: Or if the same were exported out of the Kingdom without any Return at all, then the Case would be also the same or worse: But if what is levied as aforesaid, be only transferred from one Hand to another, then we are only to consider whether the said Money or Commodities, are taken from an improving Hand, and given to an ill Husband, or *vice versa*: As for Example, suppose that Money by Way of *Tax*, be taken from one who spendeth the same in superfluous eating and drinking; and delivered to another

who employeth the same in improving of Land, in Fishing, in working of Mines, in Manufacture, &c. It is manifest, that such Tax is an Advantage to the State whereof the said different Persons are Members : Nay, if Money be taken from him, who spendeth the same as aforesaid upon eating and drinking, or any other perishing Commodity ; and the same transferr'd to one that bestoweth it on Cloaths ; I say, that even in this Case, the Commonwealth hath some little Advantage ; because Cloaths do not altogether perish so soon as Meats and Drinks : But if the same be spent in Furniture of Houses, the Advantage is yet a little more ; if in building of Houses, yet more ; if in improving of Lands, working of Mines, Fishing, &c. yet more ; but most of all, in bringing Gold and Silver into the Country ; because those Things are not only not perishable, but are esteemed for Wealth at all Times, and every where : Whereas other Commodities which are perishable, or whose Value depends upon the Fashion, or which are contingently scarce and plentiful, are Wealth but *pro hic & nunc*, as shall be elsewhere said.

In the next Place if the People of any Country, who have not already a full Employment, should be enjoined or taxed to work upon such Commodities as are imported from abroad ; I say that such a Tax also doth improve the Commonwealth.

Moreover,

Moreover, if Persons who live by begging, cheating, stealing, gaming, borrowing without Intention of restoring; who by those Ways do get from the credulous and careless, more than is sufficient for the Subsistence of such Persons; I say, that although the State should have no present Employment for such Persons, and consequently should be forced to bear the whole Charge of their Livelihood; yet it were more for the publick Profit to give all such Persons a regular and competent Allowance by publick Tax, than to suffer them to spend extravagantly, at the only Charge of credulous, careless, and good-natured People; and to expose the Commonwealth to the Loss of so many able Men, whose Lives are taken away for the Crimes which ill Discipline doth occasion.

On the contrary, if the Stocks of laborious and ingenious Men, who are not only beautifying the Country where they live, by elegant Dyet, Apparel, Furniture, Housing, pleasant Gardens, Orchards, and publick Edifices, &c. but are also increasing the Gold, Silver, and Jewels of the Country by Trade and Arms; I say, if the Stock of these Men should be diminished by a Tax, and transferred to such as do nothing at all but eat and drink, sing, play, and dance; nay to such as study the Metaphysics, or other needless Speculation; or else employ themselves in any other Way, which produces no material Thing, or Things of real Use and Value in the Commonwealth: In this Case,

the Wealth of the Publick will be diminished, otherwise than as such Exercises are Recreations and Refreshments of the Mind ; and which being moderately used, do qualify and dispose Men to what in itself is more considerable.

Wherefore upon the whole Matter, to know whether a Tax will do Good or Harm, the State of the People, and their Employments, must be well known ; (that is to say) what Part of the People are unfit for Labour by their Infancy or Impotency ; and also what Part are exempt from the same, by Reason of their Wealth, Function, or Dignities ; or by Reason of their Charge and Employments ; otherwise than in governing, directing, and preserving those who are appointed to Labour and Arts.

2. In the next Place Computation must be made, what Part of those who are fit for Labour and Arts as aforesaid, are able to perform the Work of the Nation in its present State and Measure.

3. It is to be considered, whether the Remainder can make all or any Part of those Commodities which are imported from abroad ; which of them, and how much in particular ; The Remainder of which Sort of People (if any be) may safely and without possible Prejudice to the Commonwealth, be employed in Arts and Exercises of Pleasure and Ornament ; the greatest whereof is the Improvement of natural Knowledge,

Having

Having thus in general illustrated this Point, which I think needs no other Proof but Illustration, I come next to intimate that no Part of *Europe* hath paid so much by Way of Tax, and publick Contribution, as *Holland* and *Zealand* for this last 100 Years; and yet no Country hath in the same Time increased their Wealth comparably to them; And it is manifest they have followed the general Considerations above-mentioned; for they tax Meats and Drinks most heavily of all, to restrain the excessive Expence of those Things, which 24 Hours doth (as to the Use of Man,) wholly annihilate, and they are more favourable to Commodities of greater Duration.

Nor do they tax according to what Men gain, but in extraordinary Cases, but always according to what Men spend; And most of all, according to what they spend needlessly, and without Prospect of Return. Upon which Grounds, their Customs upon Goods imported and exported are generally low; as if they intended by them, only to keep an Account of their foreign Trade, and to retaliate upon their Neighbour States the Prejudices done them by their Prohibitions and Impositions.

It is further to be observed, that since the Year 1636, the Taxes and publick Levies made in *England*, *Scotland*, and *Ireland*, have been prodigiously greater than at any Time heretofore; and yet the said Kingdoms have increased in their Wealth and Strength, for these last Forty Years, as shall hereafter be shewn.

It is said that the King of *France*, at present, doth levy the fifth Part of his People's Wealth; and yet great Ostentation is made of the present Riches and Strength of that Kingdom. Now great Care must had in distinguishing between the Wealth of the People, and that of an absolute Monarch, who taketh from the People, where, when, and in what Proportion he pleaseth. Moreover, the Subjects of two Monarchs may be equally rich, and yet one Monarch may be double as rich as the other; *viz.* If one take the tenth Part of the People's Substance to his own Dispose, and the other but the twentieth; nay the Monarch of a poorer People may appear more splendid and glorious than that of a richer, which perhaps may be somewhat the Case of *France*, as hereafter shall be examined. As an Instance and Application of what hath been said, I conceive that in *Ireland* wherein are about 1200 Thousand People, and near 300 Thousand Smokes or Hearths, it were more tolerable for the People, and more profitable for the King, that each Head paid 2 s. worth of Flax, than that each Smoke should pay 2 s. in Silver; and that for the following Reasons.

1. *Ireland* being under-peopled, and Land and Cattle being very cheap, there being every where Store of Fish and Fowl; the Ground yielding excellent Roots (and particularly that bread-like Root Potatoes) and withal they being able to perform their Husbandry, with such Harnesse
and

and Tackling as each Man can make with his own Hands, and living in such Houses as almost every Man can build; and every House-wife being a Spinner and Dyer of Wool and Yarn, they can live and subsist after their present Fashion, without the Use of Gold or Silver Money; and can supply themselves with the Necessaries above-named, without labouring 2 Hours *per Diem*: Now it hath been found, that by Reason of Insolvencies arising rather from the Usefulness than Want of Money among these poor People, that from 300 Thousand Hearths, which should have yielded 30 Thousand Pound *per Annum*, not 15 Thousand Pound of Money could be levied: Whereas it is easily imagined, that four or five People dwelling in that Cottage which hath but one Smoke, could easily have planted a Ground-plot of about 40 Foot square with Flax, or the 50 Part of an Acre, for so much Ground will bear eight or ten Shillings worth of that Commodity; and the Rent of so much Ground in few Places amounts to a Penny *per Annum*. Nor is there any Skill requisite to this Practice, wherewith the Country is not already familiar. Now as for a Market for the Flax, there is imported into *Holland* itself, over and above what that Country produces, as much Flax as is there sold for between Eightscore and Two Hundred Thousand Pound; and into *England* and *Ireland* is imported as much Linnen Cloth made of Flax, and there spent, as is worth above $\frac{1}{2}$ a Million

Million of Money, As shall hereafter be shewn,

Wherefore having shewn, that Silver Money is useles to the poor People of *Ireland*; that half the Hearth Money could not be raised by Reason thereof; that the People are not a fifth Part employed; that the People and Land of *Ireland* are competently qualified for Flax; that one Penny-worth of Land will produce ten Shillings worth of the same; and that there is Market enough and enough for above 100000 Pounds worth; I conceive my Proposition sufficiently proved; at least to set forwards and promote a Practice which both the present Law and Interest of the Country doth require: Especially, since if all the Flax so produced should yield nothing, yet there is nothing lost; the same Time having been worse spent before, Upon the same Grounds, the like Tax of 2 s. per Head, may be raised with the like Advantage upon the People of *England*, which will amount to Six Hundred Thousand Pound *per Annum*; to be paid in Flax, manufactured into all the Sorts of Linnens, Threads, Tapes, and Laces; which we now receive from *France, Flanders, Holland, and Germany*; the Value whereof doth far exceed the Sum last-mentioned, as hath appeared by the Examination of Particulars.

It is observed by Clothiers, and others, who employ great Numbers of poor People, that when Corn is extremely plentiful, that the Labour of the Poor is proportionably dear, and scarce

scarce to be had at all (so licentious are they who labour only to eat, or rather to drink.) Wherefore when so many Acres sown with Corn, as do usually produce a sufficient Store for the Nation, shall produce perhaps double to what is expected or necessary; it seems not unreasonable that this common Blessing of God should be applied to the common Good of all People, represented by their Sovereign; much rather than the same should be abused by the vile and brutish Part of Mankind, to the Prejudice of the Commonwealth; And consequently, that such Surplusage of Corn should be sent to publick Store-houses; from thence to be disposed of, to the best Advantage of the Publick.

Now if the Corn spent in *England*, at five Shillings *per* Bushel Wheat, and two Shillings Sixpence Barley, be worth ten Millions *communibus annis*; it follows that in Years of great Plenty, when the said Grains are one third Part cheaper, that a vast Advantage might accrue to the Commonwealth, which now is spent in over-feeding of the People, in Quantity or Quality; and so indisposing them to their usual Labour.

The like may be said of Sugar, Tobacco, and Pepper, which Custom hath now made necessary to all Sorts of People; and which the over-planting of them hath made unreasonably cheap: I say it is not absurd that the Publick should be advantaged by this extraordinary Plenty. That

That an Excise should be laid on Currants also, is not unreasonable; not only for this but for other Reasons also.

The Way of the present Militia or Trained Bands is a gentle Tax upon the Country; because it is only a few Days Labour in the Year, of a few Men in respect of the Whole; using their own Goods, that is their own Arms. Now if there be three Millions of Males in *England*, there must be above 200 Thousand of them who are between the Age of 16 and 30, unmarried Persons, and who live by their Labour and Service; for of so many, or thereabouts, the present Militia consists.

Now if an hundred and fifty Thousand of these were armed and trained as Foot, and fifty Thousand as Horse, (Horse being of special Advantage in Islands) the said Forces at Land, with thirty Thousand Men at Sea, would, by God's ordinary Blessing, defend this Nation, being an Island, against any Force in View: But the Charge of arming, disciplining, and rendezvousing all these Men twice or thrice a Year, would be a very gentle Tax, levied by the People themselves, and paid to themselves. Moreover if out of the said Number; Part were selected of such as are more than ordinarily fit and disposed for War, and to be exercised and rendezvoused fourteen or fifteen Times *per Annum*; the Charge thereof being but a Fortnight's Pay in the Year, would be also a very gentle Tax.

Lastly,

Lastly, if out of this last-mentioned Number, again should be selected, making about sixteen thousand Foot, and near six thousand Horse to be exercised and rendezvoused forty Days in the Year; I say that the Charge of all these three Militias, allowing the latter six Weeks Pay *per Annum* would not cost above one hundred and twenty thousand Pound *per Annum*; which I take to be an easy Burthen for so great a Benefit.

Forasmuch as the present Navy of *England* requires thirty-six thousand Men to man it; and for that the *English* Trade of Shipping requires about forty-eight thousand Men to manage it also; it follows, that to perform both well, there ought to be about seventy-two thousand Men, (and not eighty-four thousand) competently qualified for these Services: For Want whereof we see, that it is a long while before a Royal Navy can be manned; which till it be, is of no effectual Use, but lies at Charge. And we see likewise upon these Occasions, that Merchants are put to great Straights and Inconveniencies; and do pay excessive Rates for the carrying on their Trade. Now if twenty-four thousand able-bodied Tradesmen, were by six thousand of them *per Annum*, brought up and fitted for Sea-Service; and for their Encouragement allowed 20 s. *per Annum* for every Year they had been at Sea, even when they stay at home, not exceeding 6 l. for those who have served six Years or upward; it follows, that about

about 72000*l.* at the Medium of 3 *l.* per Man, would pay the whole Number of twenty-four Thousand; and so, forasmuch as half the Seamen which manage the Merchants Trade, are supposed to be always in Harbour, and are about twenty-four thousand Men, with the said half together of the Auxiliaries last-mentioned, would upon all Emergencies man out the whole Royal Navy with thirty-six Thousand, and leaving to the Merchants twelve Thousand of the abler Auxiliaries, to perform their Business in Harbour, till others come home from Sea; and thus thirty-six Thousand, twenty-four Thousand, and twelve Thousand, make the seventy-two Thousand abovementioned: I say that more than this Sum of 72000*l.* is fruitlessly spent, and over-paid by the Merchants, whensoever a great Fleet is to be fitted out. Now these whom I call Auxiliary Seamen, are such as have another Trade besides, wherewith to maintain themselves, when they are not employed at Sea; and the Charge of maintaining them, though 72000 *l.* per Annum, I take to be little or nothing, for the Reasons above-mentioned, and consequently an easy Tax to the People, because levied by, and paid to themselves.

As we propounded that *Ireland* should be taxed with Flax, and *England* by Linnen, and other Manufacture of the same, I conceive that *Scotland* also might be taxed as much, to be paid in Herrings, as *Ireland* in Flax: Now the
three

three Taxes (*viz.*) of Flax, Linnen, and Herrings, and the Maintenance of the triple Militia, and of the auxiliary Seamen above-mentioned, do all five of them together, amount to one Million of Money, the raising whereof is not a Million spent, but Gain unto the Commonwealth, unless it can be made appear, that by Reason of all, or any of them, the Exportation of Woollen Manufactures, Lead, and Tin, are lessened; or of such Commodities as our own *East* and *West India* Trade do produce, forasmuch as I conceive, that the Exportation of these last-mentioned Commodities is the Touch-stone whereby the Wealth of *England* is tried, and the Pulse whereby the Health of the Kingdom may be discerned.

C H A P. III.

That France cannot, by Reason of natural and perpetual Impediments, be more powerful at Sea, than the English, or Hollanders, now are, or may be.

POWER at Sea consists chiefly of *Men able to fight at Sea*, and that in such Shipping as is most proper for the Seas wherein they serve; and those are, in these Northern Seas, Ships from between three Hundred to one Thousand three hundred Tons; and of those such as draw much Water, and have a deep Latch in the Sea, in order to keep a good Wind, and not to fall to Leeward, a matter of vast Advantage

vantage in Sea Service: Wherefore it is to be examined, 1. Whether the King of *France* hath Ports in the Northern Seas (where he hath most Occasion for his Fleets of War, in any Contests with *England*) able to receive the Vessels above-mentioned, in all Weathers, both in Winter and Summer Season. For if the King of *France* should bring to Sea an equal Number of fighting Men with the *English* and *Hollanders*, in small floaty Leeward Vessels, he would certainly be of the weaker Side. For a Vessel of one thousand Tons manned with five hundred Men, fighting with five Vessels of two hundred Tons, each manned with one hundred Men a piece, shall in common Reason have the better offensively and defensively; forasmuch as the great Ship can carry such Ordnance, as can reach the small ones at a far greater Distance than those can reach, or at least hurt the other; and can batter, and sink at a Distance, when small ones can scarce pierce.

Moreover it is more difficult for Men out of a small Vessel to enter a tall Ship, than for Men from a higher Place to leap down into a lower; nor is small Shot so effectual upon a tall Ship, as *vice versa*.

And as for Vessels drawing much Water, and consequently keeping a good Wind, they can take or leave leeward Vessels at Pleasure, and secure themselves from being boarded by them: Moreover the windward Ship has a fairer Mark at a leeward Ship, than *vice versa*; and can
place

place her Shot upon such Parts of the leeward Vessel, as upon the next Tack will be under Water.

Now then the King of *France* having no Ports able to receive large windward Vessels, between *Dunkirk* and *Ushant*, what other Ships he can bring into those Seas, will not be considerable. As for the wide Ocean, which his Harbours of *Brest* and *Charente* do look into, it affordeth him no Advantage upon an Enemy; there being so great a Latitude of engaging or not, even when the Parties are in Sight of each other.

Wherefore, although the King of *France* were immensely rich, and could build what Ships he pleased, both for Number and Quality; yet if he have not Ports to receive and shelter that Sort and Size of Shipping, which is fit for his Purpose; the said Riches will in this Case be fruitless, and a mere Expence without any Return or Profit. Some will say that other Nations cannot build so good Ships as the *English*; I indeed hope they cannot; but because it seems too possible that they may sooner or later, by Practice and Experience, I shall not make use of that Argument, having bound myself to shew, that the Impediments of *France*, (as to this Purpose) are natural and perpetual. Ships and Guns do not fight of themselves, but Men who act and manage them; wherefore it is more material to shew, that the King of *France* neither hath, nor can have Men sufficient to

K

man

man a Fleet of equal Strength to that of the King of *England*, (*viz.*)

The King of *England's* Navy, consists of about 70 thousand Tons of Shipping, which requires 36 thousand Men to man it; these Men being supposed to be divided into eight Parts, I conceive that one eighth Part must be Persons of great Experience and Reputation in Sea-Service: another eighth Part must be such as have used the Sea seven Years and upwards; half of them, or $\frac{3}{4}$ Parts more must be such as have used the Sea above a Twelvemonth, *viz.* two, three, four, five, or six Years, allowing but one Quarter of the whole Complements to be such as never were at Sea at all, or at most but one Voyage, or upon one Expedition; so that at a Medium I reckon, that the whole Fleet must be Men of three or four Years Growth, one with another. *Fournier*, a late judicious Writer, making it his Business to persuade the World, how considerable the King of *France* was, or might be, at Sea, in the 92^d and 93^d. Pages of his *Hydrography*, saith, That there was one Place in *Britany*, which had furnished the King with 1400 Seamen, and that perhaps the whole Sea-Coast of *France* might have furnished him with 15 Times as many: Now supposing his whole Allegation were true, yet the said Number amounts but to 21000; all which, if the whole Trade of Shipping in *France* were quite and clean abandoned, would not, by above $\frac{1}{3}$, man out a Fleet equivalent to that of the King of
Eng-

England: And if the Trade were but barely kept alive, there would not be $\frac{1}{3}$ Part Men enough to man the said Fleet.

But if the Shipping Trade of *France* be not above $\frac{1}{2}$ as great as that of *England*, and that $\frac{1}{3}$ Part of the same, namely the Fishing Trade to the Banks of *Newfoundland*, is not peculiar, nor fixt to the *French*; then I say that if the King of *England* (having Power to press Men) cannot under two or three Months Time man his Fleet, then the King of *France*, with less than $\frac{1}{4}$ of the same Help, can never do it at all; for in *France* (as shall elsewhere be shewn) there are not above 150000 Ton of trading Vessels, and consequently not above 15000 Seamen, reckoning a Man to every ten Ton. As it has been shewn that the King of *France* cannot at present man such a Fleet as is above described, we come next to shew that he never can, being under natural and perpetual Impediments, *viz.*

1. If there be but 15000 Seamen in all *France*, to manage its Trade, it is not to be supposed, that the said Trade should be extinguished, nor that it should spare above 5 of the said 15000 towards manning the Fleet which requires 35 Thousand.

Now the deficient 30000 must be supplied one of these four Ways; either, first, by taking in Landmen, of which Sort there must not be above 10000, since the Seamen will never be contented without being the major Part, nor do they heartily wish well to Landmen at all, or

K 2

rejoice

rejoice even at those Successes of which the Landmen can claim any Share; thinking it hard that themselves, who are bred to miserable, painful; and dangerous Employments, (and yet profitable to the Commonwealth) should, at a Time when Booty and Purchase is to be gotten, be clogged or hindered by any Conjunction with Landmen, or forced to admit those to an equal Share with themselves. 2. The Seamen, which we suppose 20000, must be had, that is hired, from other Nations, which cannot be without tempting them with so much Wages, as exceeds what is given by Merchants, and withal to counterpoise the Danger of being hanged by their own Prince, and allowed no Quarter if they are taken; the Trouble of conveying themselves away, when Restraints and Prohibitions are upon them; and also the Infamy of having been Apostates to their own Country and Cause: I say their Wages must be more than double to what their own Prince gives them, and their Assurance must be very great, that they shall not be at long Run abused or slighted by those who employed them; (as hating the Traitor although they love the Treason.) I say moreover, that those who will be thus tempted away, must be of the basest and lowdest Sort of Seamen, and such as have not enough of Honour and Conscience to qualify them for any Trust, or gallant Performance. 3. Another Way to increase Seamen, is to put great Numbers of Landmen upon Ships of War, in order to their
being

being Seamen ; but this Course cannot be effectual, not only for the above-mentioned Antipathy between Landmen and Seamen, but also because it is seen that Men at Sea do not apply themselves to Labour and Practice, without more Necessity than happens in over-manned Shipping. For where there are 50 Men in a Vessel, that 10 can sufficiently navigate, the supernumerary 40 will improve little: But where there shall be of 10 but 1 or 2 Supernumeraries, there Necessity will often call upon every Man to set his Hand to the Work, which must be well done at the Peril of their own Lives. Moreover Seamen shifting Vessels almost every 6 or 12 Months, do sometimes sail in small Barks, sometimes in midling Ships, and sometimes in great Vessels of Defence ; sometimes in Lighters, sometimes in Hoighs, sometimes in Ketches, sometimes in three masted Ships, sometimes they go to the Southward, sometimes to the Northward, sometimes the Coast, sometimes they coast the Ocean ; by all which Variety of Service, they do in Time compleat themselves in every Part and Circumstance of their Faculty: Whereas those who go out for a Summer, in a Man of War, have not that Variety of Practice, nor a direct Necessity of doing any Thing at all.

Besides it is 3 or 4 Years at a Medium, wherein a Seaman can be made ; neither can there be less than three Seamen to make a fourth of a Landman : Consequently the 15000 Seamen of *France* can increase but 5000 Seamen

3 or 4 Years, and unless their Trade should increase with their Seamen in Proportion, the King must be forced to bear the Charge of this Improvement out of the publick Stock, which is intolerable. So as the Question which now remains is, whether the Shipping Trade of *France* is like to increase? Upon which Account it is to be considered, 1. That *France* is sufficiently stored with all Kind of Necessaries within itself; as with Corn, Cattle, Wine, Salt, Linnen Cloth, Paper, Silk, Fruits, &c. So as they need little Shipping to import more Commodities of Weight or Bulk; neither is there any Thing of Bulk exported out of *France*, but Wines and Salt; the Weight whereof is under 100,000 Tun *per Annum*, yielding not Employment to above 25000 Ton of Shipping, and these are for the most Part *Dutch* and *English*, who are not only already in Possession of the said Trade, but also are better fitted to maintain it than the *French* are, or perhaps ever can be; And that for the following Reasons, (*viz.*) 1. Because the *French* cannot victual so cheap as the *English* and *Dutch*, nor sail with so few Hands. 2. The *French* for Want of good Coasts and Harbours, cannot keep their Ships in Port, under double the Charge that the *English* and *Hollanders* can. 3. By Reason of Paucity, and Distance of their Ports, one from another, their Seamen and Tradesmen relating to Shipping, cannot correspond with, and assist, one another so easily, cheaply, and advantageously, as in other

ther Places. Wherefore if their Shipping Trade is not likely to increase within themselves, and much less to increase by their beating out the *English* and *Hollanders* from being the Carriers of the World ; it follows that their Seamen will not be increased by the Increase of their said Trade : Wherefore, and for that they are not like to be increased by any of the several Ways above-specified, and for that their Ports are not fit to receive Ships of Burthen and Quality fit for their Purpose ; and that by Reason of the less Fitness of their Ports than that of their Neighbours ; I conceive that what was propounded hath been competently proved.

The afore-named *Fournier* in the 92d and 93d Pages of his *Hydrography* hath laboured to prove the contrary of all this, unto which I refer the Reader : Not thinking his Arguments of any Weight at all in the present Case. Nor indeed doth he make his Comparisons with the *English* or *Hollanders*, but with the *Spaniards*, who, nor the Grand Seignior, (the latter of whom hath greater Advantages to be powerful at Sea than the King of *France*) could ever attain to any illustrious Greatness in Naval Power : Having often attempted, but never succeeded in the same. Nor is it easy to believe, that the King of *England* should, for so many Years, have continued his Title to the Sovereignty of the *Narrow Seas* against his Neighbours (ambitious enough to have gotten it from him) had not their Impediments been natural and perpetual, and such, as we say, do obstruct the King of *France*.

CHAP. IV.

That the People and Territories of the King of England, are naturally near as considerable for Wealth and Strength, as those of France,

THE Author of the State of *England*, among the many useful Truths and Observations he hath set down, delivers the Proportion between the Territories of *England* and *France* to be as 30 to 82; the which if it be true, then *England*, *Scotland*, and *Ireland*, with the Islands unto them belonging, will, taken all together, be near as big as *France*. Though I ought to take all Advantages for proving the Paradox in Hand; yet I had rather grant that *England*, *Scotland*, and *Ireland*, with the Islands before-mentioned; together with the planted Parts of *Newfoundland*, *New-England*, *New-Netherland*, *Virginia*, *Mary-Land*, *Carolina*, *Jamaica*, *Bermudas*, *Barbadoes*, and all the rest of the *Carribbee* Islands, with what the King hath in *Asia* and *Africa*, do not contain so much Territory as *France*, and what planted Land the King of *France* hath also in *America*. And if any Man will be heterodox in Behalf of the *French* Interest, I would be contented against my Knowledge and Judgment to allow the King of *France's* Territories to be a seventh, sixth, or even a fifth greater than those of the King of *England*;

England; believing that both Princes have more Land, than they do employ to its utmost Use.

And here I beg Leave, (among the several Matters which I intend for serious,) to interpose a jocular, and perhaps whimsical, Digression, and which I indeed desire Men to look upon rather as a Dream, or Resvery, than a rational Proposition; the which is, that if all the Moveables and People of *Ireland*, and of the Highlands of *Scotland*, were transported into the rest of *Great Britain*; that then the King and his Subjects, would thereby become more rich and strong, both offensively and defensively, than now they are.

'Tis true, I have heard many wise Men say, when they were bewailing the vast Losses of the *English*, in preventing and suppressing Rebellions in *Ireland*, and considering how little Profit hath returned either to the King or Subjects of *England*, for their 500 Years doing and suffering in that Country; I say, I have heard wise Men (in such their Melancholies) wish, that (the People of *Ireland* being saved) that Island were sunk under Water: Now it troubles me, that the Distemper of my own Mind in this Point, carries me to dream that the Benefit of those Wishes may practically be obtained, without sinking that vast mountainous Island under Water, which I take to be somewhat difficult; for although *Dutch* Engineers may drain its Bogs, yet I know no Artists that could sink its Mountains. If ingenious and learned
Men

Men (among whom I reckon Sir *Tbo. More*, and *Des Cartes*) have disputed, that we who think ourselves awake, are or may be really in a Dream; and since the greatest Absurdities of Dreams are but a preposterous and tumultuary Contexture of Realities; I will crave the Umbrage of these great Men last named, to say something for this wild Conception, with Submission to the better Judgment of all those that can prove themselves awake.

If there were but one Man living in *England*, then the Benefit of the whole Territory could be but the Livelihood of that one Man: But if another Man were added, the Rent or Benefit of the same would be double, if two, triple; and so forward, until so many Men were planted in it, as the whole Territory could afford Food unto: For if a Man would know what any Land is worth, the true and natural Question must be, How many Men will it feed? How many Men are there to be fed? But to speak more practically, Land of the same Quantity and Quality in *England*, is generally worth 4 or 5 Times as much as in *Ireland*, and but $\frac{1}{4}$ or $\frac{1}{3}$ of what it is worth in *Holland*; because *England* is 4 or 5 Times better peopled than *Ireland*, and but $\frac{1}{4}$ so well as *Holland*. And moreover, where the Rent of Land is advanced by Reason of Multitude of People, there the Number of Years Purchase, for which the Inheritance may be sold, is also advanced, though perhaps not in the very same Proportion; for 20 s. *per Annum* in *Ireland*,

Ireland, may be worth but 8 *l.* and in *England*, where Titles are very sure, above 20 *l.* in *Holland* above 30 *l.*

I suppose that in *Ireland*, and the Highlands in *Scotland*, there may be about 1800000 People, or about $\frac{1}{3}$ Part of what is in all the 3 Kingdoms: Wherefore the first Question will be, whether *England*, *Wales*, and the Lowlands of *Scotland*, cannot afford Food, (that is to say) Corn, Fish, Flesh, and Fowl, to $\frac{1}{3}$ Part more People than are at present planted upon it, with the same Labour that the said $\frac{1}{3}$ Part do now take where they are? For if so, then what is propounded is naturally possible. 2. It is to be enquired, what the Value of the Immoveables (which upon such Removal must be left behind) are worth? For if they be worth less than the Advancement of the Price of Land in *England* will amount unto; then the Proposal is to be considered. 3. If the deserted Lands, and the Immoveables left behind upon them, may be sold for Money, or if no other Nation shall dare meddle with them, without paying well for them, and if the Nation who shall be admitted, shall be less able to prejudice and annoy the Transplantees into *England* than before; then I conceive that the whole Proposal will be a pleasant and a profitable Dream indeed.

As to the first Point, whether *England* and the Lowlands of *Scotland* can maintain $\frac{1}{3}$ Part more People than they now do (that is to say) 9 Millions of Souls in all? For Answer thereunto,

unto, I first say, that the said Territories of *England*, and the Lowlands of *Scotland*, contain about 36 Millions of Acres, that is 4 Acres for every Head, Man, Woman, and Child; but the United Provinces do not allow above 1 Acre and $\frac{1}{2}$, and *England* itself, rescinding *Wales*, hath but 3 Acres to every Head, according to the present State of Tillage and Husbandry. Now if we consider that *England* having but 3 Acres to a Head as aforesaid, doth so abound in Victuals, as that it maketh Laws against the Importation of Cattle, Flesh, and Fish from abroad; and that the draining of Fens, improving of Forests, inclosing of Commons, Sowing of St. Foyn and Clover-grass, be grumbled against by Landlords, as the Way to depress the Price of Victuals; then it plainly follows, that less than 3 Acres improved as it may be, will serve the Turn, and consequently that 4 will suffice abundantly. I could here set down the very Number of Acres that would bear Bread and Drink, Corn, together with Flesh, Butter, and Cheese, sufficient to victual 9 Millions of Persons, as they are victualled in Ships and regular Families; but shall only say in general, that 12 Millions of Acres, viz. $\frac{1}{3}$ of 36 Millions, will do it, supposing that Roots, Fruits, Fowl, and Fish, and the ordinary Profit of Lead, Tin, Iron-Mines, and Woods, would piece up any Defect that may be feared.

As to the second, I say, that the Land and Housing in *Ireland*, and the Highlands of *Scotland*

land, at the present Market Rates, are not worth 13 Millions of Money; nor would the actual Charge of making the Transplantation proposed amount to 4 Millions more: So then the Question will be, whether the Benefit expected from this Transplantation will exceed 17 Millions.

To which I say, that the Advantage will probably be near 4 Times the last-mentioned Sum, or about 69,300,000 *l.* For if the Rent of all *England* and *Wales*, and the Lowlands of *Scotland*, be about 9 Millions *per Annum*, and if the fifth Part of the People be superadded unto the present Inhabitants of those Countries; then the Rent will amount unto 10,008,000 *l.* and the Number of Years Purchase will rise from 17 $\frac{1}{2}$, to $\frac{1}{5}$ more, which is 21. So as the Land which is now worth but 9 Millions *per Annum*, at 17 $\frac{1}{2}$ Years Purchase, making 157 Millions and $\frac{1}{2}$, will then be worth 10800000 *l.* at 21 Years Purchase; *viz.* 226,800,000 *l.* that is 69,300,000 *l.* more than it was before.

And if any Prince, willing to enlarge his Territories, will give any Thing more than 6 $\frac{1}{2}$ Millions, or half the present Value for the said relinquished Lands, which are estimated to be worth 13 Millions; then the whole Profit will be above 75,800,600 *l.* or above 4 Times the Loss, as the same was above computed. But if any Man shall object, that it will be dangerous unto *England*, that *Ireland* should be in the Hands of any other Nation; I answer in short, that that Nation, whoever shall purchase it (be-
ing

ing divided by Means of the said Purchase) shall not be more able to annoy *England* than now in its united Condition. Nor is *Ireland* nearer *England*, than *France* and *Flanders*.

Now if any Man shall desire a more clear Explanation, how, and by what Means, the Rents of Lands shall rise by this closer Cohabitation of People above described? I answer, that the Advantage will arise in transplanting about 1800000 People from the poor and miserable Trade of Husbandry, to more beneficial Handicrafts: For when the Superaddition is made, a very little Addition of Husbandry to the same Lands will produce $\frac{1}{2}$ more of Food, and consequently the additional Hands, earning but 40s. *per Annum* (as they may very well do, nay to 8 l. *per Annum*) at some other Trade; the Superlucration will be above 3,600000 l. *per Annum*, which at 20 Years Purchase is 70 Millions. Moreover, as the Inhabitants of Cities and Towns spend more Commodities, and make greater Consumptions, than those who live in wild, thin-peopled Countries; so when *England* shall be thicker peopled, in the same Manner before described, the very same People shall then spend more, than when they lived more fordidly and inurbanely, and farther asunder, and more out of the Sight, Observation, and Emulation of each other; every Man desiring to put on better Apparel when he appears in Company, than when he has no Occasion to be seen.

I fur-

I further add, that the Charge of the Government, civil, military, and ecclesiastical, would be more cheap, safe and effectual in this Condition of closer Cohabitation than otherwise; as not only Reason, but the Example of the United Provinces doth demonstrate.

But to let this whole Digression pass for a mere Dream, I suppose 'twill serve to prove, that in Case the King of *England's* Territories should be a little less than those of the King of *France*, that forasmuch as neither of them are over-peopled, that the Difference is not material to the Question in Hand; wherefore supposing the King of *France's* Advantages to be little or nothing in this Point of Territory, we come next to examine and compare the Number of Subjects which each of these Monarchs doth govern.

The Book called the State of *France*, maketh that Kingdom to consist of 27000 Parishes; and another Book written by a substantial Author, who professedly inquires into the State of the Church and Churchmen of *France*, sets it down as an extraordinary Case, that a Parish in *France* should have 600 Souls; wherefore I suppose that the said Author (who hath so well examined the Matter) is not of Opinion that every Parish, one with another, hath above 500; by which Reckoning the whole People of *France* are about 13 Millions and $\frac{1}{2}$; now the People of *England*, *Scotland*, and *Ireland*, with the Islands adjoining, by Computation from the Numbers
of

of Parishes, which commonly have more People in Protestant Churches than in Popish Countries; as also from the Hearth-money, Poll-money, and Excise, do amount to about 9 Millions and $\frac{1}{2}$.

There are in *New-England* about 16000 Men mustered in Arms; about 24000 able to bear Arms, and consequently about 150000 in all: And I see no Reason why in all this and the other Plantations of *Asia*, *Africa*, and *America*, there should not be half a Million in all. But this last I leave to every Man's Conjecture, and consequently I suppose that the King of *England* hath about 10 Millions of Subjects, *ubivis Terrarum Orbis*, and the King of *France* about 13 $\frac{1}{2}$ as aforesaid.

Although it be very material to know the Number of Subjects belonging to each Prince, yet when the Question is concerning their Wealth and Strength, it is also material to examine, how many of them do get more than they spend, and how many less.

In Order whereunto it is be considered, that in the King of *England's* Dominions, there are not 20000 Churchmen; but in *France*, as the afore-mentioned Author of theirs doth aver, (who sets down the particular Number of each religious Order) there are about 270000; *viz.* 250000 more than we think are necessary, (that is to say) 250000 withdrawn out of the World. Now the said Number of adult and able-bodied Persons are equivalent to about double the same
Number

Number of the promiscuous Mass of Mankind, And the same Author says, that the same religious Persons do spend one with another about 18 *d. per Diem*, which is triple even to what a labouring Man requires.

Wherefore the said 250000 Churchmen (living as they do) makes the King of *France's* 13 Millions and a half, to be less than 13: Now if 10 Men can defend themselves as well in Islands, as 13 can upon the Continent, then the said 10 being not concerned to increase their Territory by the Invasion of others, are as effectual as the 13 in Point of Strength also; wherefore that there are more Superlucrators in the *English* than the *French* Dominions, we say as followeth.

There be in *England, Scotland, Ireland*, and the King's other Territories, above 40000 Seamen; in *France* not above $\frac{1}{4}$ so many; but one Seaman earneth as much as 3 common Husbandmen; wherefore this Difference in Seamen, added to the Account of the King of *England's* Subjects, is an Advantage equivalent to 60000 Husbandmen.

There are in *England, Scotland, and Ireland*, and all other the King of *England's* Territories, 600000 Ton of Shipping, worth about 4 $\frac{1}{2}$ Millions of Money; and the annual Charge of maintaining the Shipping of *England* by new Buildings and Reparations, is about $\frac{1}{2}$ Part of the same Sum; which is the Wages of 150000 Husbandmen, but is not the Wages of above $\frac{1}{2}$ Part of so many Artisans as are employed up-

on Shipping of all Sorts; viz. Shipwrights, Calkers, Joiners, Carvers, Painters, Block-makers, Rope-makers, Mast-makers, Smiths of several Sorts, Flag-makers, Compass-makers, Brewers, Bakers, and all other Sort of Victuallers; all Sorts of Tradesmen relating to Guns, and Gunners Stores. Wherefore there being 4 Times more of these Artisans in *England, &c.* than in *France*, they further add to the Account of the King of *England's* Subjects, the Equivalent of 80000 Husbandmen more.

The Sea-line of *England, Scotland, and Ireland*, and the adjacent Islands, is about 3800 Miles; according to which Length, and the whole Content of Acres, the said Land would be an oblong or parallelogram Figure of 3800 Miles long, and about 24 Miles broad; and consequently every Part of *England, Scotland, and Ireland*, is one with another, but 12 Miles from the Sea: Whereas *France* containing but about 1000 Miles of Sea-line, is by the like Method or Computation, about 65 Miles from the Sea-side; and considering the Paucity of Ports, in Comparison of what are in the King of *England's* Dominions, as good as 70 Miles distant from a Port: Upon which Grounds it is clear, that *England* can be supplied, with all gross and bulky Commodities of foreign Growth and Manufacture, at far cheaper Rates than *France* can be, viz. at about 4 s. per Cent. cheaper; the Land-Carriage for the Difference of the Distance between *England* and *France* from

from a Port, being so much or near thereabouts. Now to what Advantage this Conveniency amounteth, upon the Importation and Exportation of bulky Commodities, cannot be less than the Labour of one Million of People, &c. meaning by bulky Commodities all Sort of Timber, Plank, and Staves for Cask; all Iron, Lead, Stones, Bricks, and Tyles for building; all Corn, Salt, and Drinks; all Flesh and Fish, and indeed all other Commodities, wherein the Gain and Loss of 4 s. *per Cent.* is considerable; where note that the like Wines are sold in the inner Parts of *France* for 4 or 5 l. a Tun, which near the Ports yield 7 l. Moreover upon this Principle the Decay of Timber in *England* is no very formidable Thing, as the Rebuilding of *London*, and of the Ships wasted by the *Dutch War* do clearly manifest; nor can there be any Want of Corn, or other necessary Provisions in *England*, unless the Weather hath been universally unseasonable for the Growth of the same; which seldom or never happens; for the same Causes which make Dearth in one Place, do often cause Plenty in another; wet Weather being propitious to Highlands, which drowneth the Low.

It is observed that the Poor of *France* have generally less Wages than in *England*, and yet their Victuals are generally dearer there; which being so, there may be more Superlucration in *England* than in *France*.

Lastly, I offer it to the Consideration of all those, who have travelled through *England* and *France*; Whether the Plebeians of *England* (for they constitute the Bulk of any Nation) do not spend; Part more than the Plebeians of *France*? And if so, it is necessary that they must first get it; and consequently that 10 Millions of the King of *England*'s Subjects are equivalent to 12 of the King of *France*; and upon the whole Matter, to the 13 Millions, at which the *French* Nation was estimated.

It will here be objected, that the Splendor and Magnificencies of the King of *France*, appearing greater than those of *England*, that the Wealth of *France* must be proportionably greater than that of *England*; but that doth not follow, forasmuch as the apparent Greatness of the King doth depend upon the *quota pars* of the People's Wealth which he levyeth from them; for supposing of the People to be equally rich, if one of the Sovereigns levy a fifth Part, and another a fifteenth, the one seems actually thrice as rich as the other, whereas potentially, they are but equal.

Having thus discoursed of the Territory, People, Superlucration, and Defencibleness of both Dominions, and in some Measure of their Trade, so far as we had Occasion to mention Ships, Shipping, and Nearness to Ports; we come next to enlarge a little further upon the Trade of each.

Some have estimated, that there are not above 300 Millions of People in the whole World. Whether that be so or no, is not very material to be known; but I have fair Grounds to conjecture, and would be glad to know it more certainly, that there are not above 80 Millions with whom the *English* and *Dutch* have Commerce; no *Europeans* that I know of, trading directly or indirectly, where they do not; so as the whole commercial World, or World of Trade, consisteth of about 80 Millions of Souls, as aforesaid.

And I further estimate, that the Value of all Commodities yearly exchanged amongst them, doth not exceed the Value of 45 Millions: Now the Wealth of every Nation, consisting chiefly in the Share which they have in the Foreign Trade with the whole commercial World, rather than in the domestick Trade, of ordinary Meat, Drink, and Cloaths, &c. which bringing in little Gold, Silver, Jewels, and other universal Wealth; we are to consider, whether the Subjects of the King of *England*, Head for Head, have not a greater Share than those of *France*.

To which Purpose it hath been considered, that the Manufactures of Wool, yearly exported out of *England* into several Parts of the World, viz. All Sorts of Cloth, Serges, Stuffs, Cottons, Bayes, Sayes, Frize, Perpetuanas; as also Stockings, Caps, Rugs, &c. exported out of *England*, *Scotland*, and *Ireland*, do amount unto 5 Millions *per Annum*.

The Value of Lead, Tin, and Coals, to be 500,000 *l.*

The Value of all Cloaths, Household-stuff, &c. carried into *America*, 200,000 *l.*

The Value of Silver and Gold taken from the *Spaniards* 60,000 *l.*

The Value of Sugar, Indigo, Tobacco, Cotton, and Cocoa, brought from the Southward Parts of *America* 600,000 *l.*

The Value of the Fish, Pipe-staves, Masts, Bever, &c. brought from *New England*, and the Northern Parts of *America* 200,000 *l.*

The Value of the Wool, Butter, Hides, Tallow, Beef, Herring, Pilchers, and Salmon, exported out of *Ireland*, 800,000 *l.*

The Value of the Coals, Salt, Linnen, Yarn, Herrings, Pilchers, Salmon, Linnen-Cloth, and Yarn, brought out of *Scotland*, and *Ireland*, 500,000 *l.*

The Value of Salt-peter, Pepper, Callicoes, Diamonds, Drugs and Silks, brought out of the *East-Indies*, above what was spent in *England*, 800,000 *l.*

The Value of the Slaves, brought out of *Africa*, to serve in our *American* Plantations, 20000 *l.*; which with the Freight of *English* Shipping, trading into foreign Parts, being above 1 Million and $\frac{1}{2}$, makes in all 10180000 *l.*

Which Computation is sufficiently justified by the Customs of the 3 Kingdoms, whose intrinick Value are thought to be near a Million per Annum, viz. 600,000 *l.* payable to the King;

King; 100,000 *l.* for the Charges of Collecting, &c. 200,000 *l.* smuggled by the Merchants, and 100,000 *l.* gained by the Farmers; according to common Opinion and Mens Sayings: And this agrees also with that Proportion or Part of the whole Trade of the World, which I have estimated the Subjects of the King of *England* to be possessed of, *viz.* of about 10 of 45 Millions.

But the Value of the *French* Commodities brought into *England*, (notwithstanding some current Estimates,) are not above 1200000 *l.* *per Annum*; and the Value of all they export into all the World besides, not above 3 or 4 Times as much; which Computation also agreeth well enough with the Account we have of the Customs of *France*; so as *France* not exporting above the Value of what *England* doth, and for that all the Commodities of *France* (except Wines, Brandy, Paper, and the first Patterns and Fashions for Cloaths and Furniture (of which *France* is the Mint) are imitable by the *English*, and having withal more People than *England*, it follows that the People of *England*, &c. have Head for Head, thrice as much Foreign Trade as the People of *France*; and about 2 Parts of 9 of the Trade of the whole commercial World; and about 2 Parts in 7 of all the Shipping: Notwithstanding all which it is not to be denied, that the King and some great Men of *France*, appear more rich and splendid; than these of the like Quality in *England*;

all which arises rather from the Nature of their Government, than from the intrinsic and natural Causes of Wealth and Power.

CH A P. V.

That the Impediments of England's Greatness are but contingent and removable.

THE first Impediment of *England's Greatness* is, that the Territories thereunto belonging are too far asunder, and divided by the Sea into many several Islands and Countries; and I may say, into so many Kingdoms, and several Governments, (*viz.*) there be three distinct Legislative Powers in *England, Scotland, and Ireland*; the which instead of uniting together, do often cross one anothers Interest; putting Bars and Impediments upon one anothers Trades, not only as if they were Foreigners to each other, but sometimes as Enemies.

2, The Islands of *Jersey* and *Guernsey*, and the *Isle of Man*, are under Jurisdictions different from those either of *England, Scotland, or Ireland*.

3. The Government of *New England* (both civil and ecclesiastical) doth so differ from that of his Majesty's other Dominions, that 'tis hard to say what may be the Consequence of it.

And the Government of the other Plantations doth also differ very much from any of the rest; although there be not naturally substantial Reasons from the Situation, Trade, and
Con-

Condition of the People, why there should be such Differences.

From all which it comes to pass, that small divided remote Governments being seldom able to defend themselves, the Burthen of protecting of them all, must lye upon the chief Kingdom *England*; and so all the smaller Kingdoms and Dominions, instead of being Additions are really Diminutions; but the same is remedied by making two such grand Councils, as may equally represent the whole Empire, one to be chosen by the King, the other by the People. The Wealth of a King is threefold, one is the Wealth of his Subjects, the second is the *quota pars* of his Subjects Wealth, given him for the publick Defence, Honour, and Ornament of the People, and to manage such Undertakings for the common Good, as no one or a few private Men are sufficient for.

The third Sort are the *quota* of the last-mentioned *quota pars*, which the King may dispose of as his own personal Inclination and Discretion shall direct him, without Account. Now it is most manifest, that the afore-mentioned Distances and Differences, of Kingdoms and Jurisdictions, are great Impediments to all the said several Sorts of Wealth, as may be seen in the following Particulars. 1st, In Case of War with Foreign Nations, *England* commonly beareth the whole Burthen, and Charge, whereby many in *England* are utterly undone.

2dly,

2dly, *England* sometimes prohibiting the Commodities of *Ireland* and *Scotland*, as of late it did the Cattle, Flesh, and Fish, of *Ireland*, did not only make Food, and consequently Labour dearer in *England*, but also hath forced the People of *Ireland* to fetch those Commodities from *France*, *Holland*, and other Places, which before was sold them from *England*, to the great Prejudice of both Nations.

3dly, It occasions an unnecessary Trouble and Charge, in collecting of Customs, upon Commodities passing between the several Nations.

4thly, It is a Damage to our *Barbadoes*, and other *American* Traders, that the Goods which might pass thence immediately, to several Parts of the World, and to be sold at moderate Rates, must first come into *England*, and there pay Duties, and afterwards (if at all) pass into those Countries, whither they might have gone immediately.

5thly, The Islands of *Fersey* and *Guernsey*, are protected at the Charge of *England*, nevertheless the Labour and Industry of that People (which is very great) redounds most to the Profit of the *French*.

6thly, In *New England* there are vast Numbers of able-bodied *Englishmen*, employed chiefly in Husbandry, and in the meanest Part of it, (which is breeding of Cattle) whereas *Ireland* would have contained all those Persons, and at worst would have afforded them Lands on better Terms than they have them in *America*, if
not

not some other better Trade withal, than now they can have.

7thly, The Inhabitants of the other Plantations, although they do indeed plant Commodities which will not grow so well in *England*; yet grasping at more Land, than will suffice to produce the-said Exotics in a sufficient Quantity to serve the whole World, they do therein but distract and confound the Effect of their own Endeavours.

8thly, There is no Doubt that the same People, far and wide dispersed, must spend more upon their Government and Protection, than the same living compactly, and when they have no Occasion to depend upon the Wind, Weather, and all the Accidents of the Sea.

A second Impediment to the Greatness of *England*, is the different understanding of several material Points, viz. Of the King's Prerogative, Privileges of Parliament, the obscure Differences between Law and Equity; as also between civil and ecclesiastical Jurisdictions; Doubts whether the Kingdom of *England* hath Power over the Kingdom of *Ireland*, besides the wonderful Paradox that *Englishmen*, lawfully sent to suppress Rebellions in *Ireland*, should after having effected the same, be (as it were) disfranchised, and lose that Interest in the Legislative Power which they had in *England*, and pay Customs as Foreigners for all they spend in *Ireland*, whither they were sent for the Honour and Benefit of *England*.

The

The third Impediment is, That *Ireland* being a conquered Country, and containing not the Tenth Part as many *Irish* Natives as there are *English* in both Kingdoms, that natural and firm Union is not made, between the Two People, by Transplantations, and proportionable Mixture, so as there may be but a Tenth Part of the *Irish* in *Ireland*, and the same Proportion in *England*; whereby the Necessity of maintaining an Army in *Ireland*, at the Expence of a Quarter of the Rents of that Kingdom, may be taken away.

The fourth Impediment is, that Taxes in *England* are not levied upon the Expence, but upon the whole Estate; not upon Lands, Stock, and Labour, but chiefly upon Land alone; and that not by any equal and indifferent Standard, but the casual Predominancy of Parties and Factions: And moreover, that these Taxes are not levied with the least Trouble and Charge, but let out to Farmers; who also let them from one to another without explicit Knowledge of what they do; but so as in Conclusion, the poor People pay twice as much as the King receives.

The fifth Impediment is the Inequality of Shires, Diocesses, Parishes, Church-Livings, and other Precincts, as also the Representation of the People in Parliament; all which do hinder the Operations of Authority in the same Manner as a Wheel irregularly made, and eccentrically hung, neither moves so easily, nor performs its Work so truly, as if the same were duly framed and poised.

6thly,

6thly, Whether it be an Impediment, that the Power of making War, and raising Money, be not in the same Hand, much may be said; but I leave it to those who may more properly meddle with fundamental Laws.

Note of these Impediments are natural, but did arise as the Irregularity of Buildings do, by being built Part at one Time, and Part at another; and by the changing of the State of Things from what they were at the respective Times, when the Practices we complain of were first admitted, and perhaps, are but the Warpings of Time, from the Rectitude of the first Institution.

As these Impediments are contingent, so they are also removeable; for may not the Land of superfluous Territories be sold, and the People with their Moveables brought away? May not the *English* in the *American* Plantations (who plant Tobacco, Sugar, &c.) compute what Land will serve their Turn, and then contract their Habitations to that Proportion, both for Quantity and Quality? As for the People of *New England*, I can but wish they were transplanted into *Old England*, or *Ireland*, (according to Proposals of their own, made within this 20 Years) although they were allowed more Liberty of Conscience, than they allow one another.

May not the three Kingdoms be united into one, and equally represented in Parliament? Might not the several Species of the King's Subjects be equally mixed in their Habitations?

Might

Might not the Parishes and other Precincts, be better equalized? Might not Jurisdictions and Pretences of Power, be determined and ascertained? Might not the Taxes be equally allotted, and directly applied to their ultimate Use? Might not Dissenters in Religion be indulged, they paying for a competent Force to keep the publick Peace? I humbly venture to say all these Things may be done, if it be so thought fit by the Sovereign Power, because the like hath often been done already, at several Places and Times.

C H A P. VI.

That the Power and Wealth of England, hath increased this last forty Years.

IT is not much to be doubted, but that the Territories under the King's Dominions have increased; forasmuch as *New England, Virginia, Barbadoes, and Jamaica, Tangier, and Bombay,* have since that Time, been either added to his Majesty's Territories, or improved from a desert Condition, to abound with People, Buildings, Shipping, and the Production of many useful Commodities. And as for the Land of *England, Scotland, and Ireland,* as it is not less in Quantity than it was forty Years since, so it is manifest that by Reason of the draining of Pans, watering of dry Grounds, improving of Forrests and Commons, making of heathy and barren Grounds to bear Saintfoyne and Clover-grass; meliora-

meliorating and multiplying several Sorts of Fruits, and Garden-stuff, making some Rivers navigable, &c. I say it is manifest, that the Land in its present Condition, is able to bear more Provision and Commodities, than it was forty Years ago.

2dly, Altho' the People in *England, Scotland, and Ireland*, which have extraordinarily perished by the Plague and Sword, within this last forty Years, do amount to about 300000, above what have died in the ordinary Way; yet the ordinary Increase by Generation of 10 Millions, which doubles in two hundred Years, as hath been shewn by the Observators upon the Bills of Mortality, may in forty Years (which is a fifth Part of the same Time) have increased one fifth Part of the whole Number, or two Millions. Where note by the Way, that the Accession of Negroes to the *American Plantations* (being all Men of great Labour and little Expence) is not inconsiderable; besides it is hoped that *New England*, where few or no Women are barren, and most have many Children, and where People live long, and healthfully, hath produced an Increase of as many People as were destroyed in the late Tumults in *Ireland*.

As for Housing, the Streets of *London* itself speaks it, I conceive it is double in Value in that City, to what it was forty Years since; and for Housing in the Country, they have increased at *Newcastle, Yarmouth, Norwich, Exeter, Portsmouth, Cowes, Dublin, Kinsale, Londonderry*, and
Cole-

Coleraine in *Ireland*, far beyond the Proportion of what I can learn have been dilapidated in other Places. For in *Ireland* where the Ruin was greatest, the Housing (taking all together) is now more valuable than forty Years ago, nor is this to be doubted, since Housing is now more splendid than in those Days, and the Number of Dwellers is increased by near one fifth Part ; as in the last Paragraph is set forth.

As for Shipping, his Majesty's Navy is now triple, or quadruple, to what it was forty Years since, and before the *Sovereign* was built ; the Shipping trading to *Newcastle*, which are now about eighty thousand Tons, could not be then above a Quarter of that Quantity. First, because the City of *London* is doubled. 2. Because the Use of Coals is also at least doubled, because they were heretofore seldom used in Chambers, as now they are, nor were there so many Bricks burned with them as of late, nor did the Country on both Sides the *Thames* make use of them as now. Besides there are employed in the *Guiney* and *American* Trade above Forty thousand Ton of Shipping *per Annum* ; which Trade in those Days was inconsiderable. The Quantity of Wines imported, was not near so much as now ; and to be short, the Customs upon imported and exported Commodities, did not then yield a third Part of the present Value ; which shews that not only Shipping, but Trade itself hath increased somewhat near that Proportion.

As

As to Money, the Interest thereof was within this fifty Years at 10 *l. per Cent.* forty Years ago at 8 *l.* and now at 6 *l.* no Thanks to any Laws which have been made to that Purpose, forasmuch as those who can give good Security, may now have it at less : But the natural Fall of Interest, is the Effect of the Increase of Money.

Moreover if rented Lands and Houses have increased ; and if Trade hath increased also, it is certain that Money which payeth those Rents, and driveth on Trade, must have increased also.

Lastly, I leave it to the Consideration of all Observers, whether the Number and Splendor of Coaches, Equipage, and Household Furniture, hath not increased since that Time ; to say nothing of the Postage of Letters, which have increased from one to twenty, which argues the Increase of Business and Negotiation. I might add that his Majesty's Revenue is near tripled, and therefore the Means to pay, and bear the same, have increased also.

C H A P. VII.

That one tenth Part of the whole Expence of the King of England's Subjects, is sufficient to maintain one hundred Thousand Foot, forty Thousand Horse, and forty Thousand Men at Sea; and defray all other Charges of the Government, both ordinary and extraordinary, if the same were regularly taxed and raised.

TO clear this Point, we are to find out what is the middle Expence of each Head in the King's Dominions, between the highest and the lowest; to which I say it is not probably less than the Expence of a Labourer, who earneth about 8 *d.* *per* Day; for the Wages of such a Man is 4 *s.* *per* Week without Victuals, or 2 *s.* with it; wherefore the Value of his Victuals is 2 *s.* *per* Week, or 5 *l.* 4 *s.* *per* Annum: Now the Value of Cloathes cannot be less than the Wages given to the poorest Maid-Servant in the Country, which is 30 *s.* *per* Annum, nor can the Charge of all other Necessaries be less than 6 *l.* *per* Annum more; wherefore the whole Charge is 7 *l.* 10 *s.*

It is not likely that this Discourse will fall into the Hands of any that live at 7 *l.* *per* Annum, and therefore such will wonder at this Supposition: But if they consider how much the Number of the Poor, and their Children, is greater than that of the Rich; although the personal Expence of some rich Men should be
 twent.

twenty Times more than that of a Labourer ; yet the Expence of the Labourer above-mentioned may well enough stand for the Standard of the Expence of the whole Mass of Mankind.

Now if the Expence of each Man, one with another, be 7 *l. per Annum*, and if the Number of the King's Subjects be ten Millions, then the tenth Part of the whole Expence will be seven Millions ; but about five Millions, or a very little more, will amount to one Year's Pay for one hundred thousand Foot, forty thousand Horse, and forty thousand Men at Sea, Winter and Summer ; which can rarely be necessary. And the ordinary Charge of the Government, in Times of deep and serene Peace, was not six hundred thousand Pound *per Annum*.

Where a People thrive, there the Income is greater than the Expence, and consequently the tenth Part of the Expence is not a tenth Part of the Income ; now for Men to pay a Tenth of their Expence, in a Time of the greatest Exigency, (for such it must be when so great Forces are requisite) can be no Hardship, much less a deplorable Condition ; for to bear the tenth Part, a Man needs spend but a twentieth Part less, and labour a twentieth Part more, or half an Hour *per Diem* extraordinary, both which, within common Experience, are very tolerable ; there being very few in *England* who do not eat by a twentieth Part more than does them good ; and what Misery were it, instead of

wearing Cloth of 20 s. per Yard, to be contented with that of 19 s. few Men having Skill enough to discern the Difference.

Mé morandum, That all this while I suppose that all of these ten Millions of People are obedient to their Sovereign, and within the Reach of his Power ; for as Things are otherwise, so the Calculation must be varied.

C H A P. VIII.

That there are spare Hands enough among the King of England's Subjects, to earn two Millions per Annum more than they now do ; and that there are also Employments ready, proper, and sufficient, for that Purpose.

TO prove this Point we must enquire, how much all the People could earn, if they were disposed or necessitated to labour, and had Work whereupon to employ themselves ; and compare that Sum with that of the total Expence above mentioned, deducting the Rents and Profits of their Land and Stock, which, properly speaking, saveth so much Labour. Now the Proceed of the said Lands and Stock in the Countries, is about three Parts of seven of the whole Expence ; so as where the Expence is seventy Millions, the Rent of the Land, and the Profit of all the personal Estate, Interest of Money, &c. must be about thirty Millions ; and consequently, the Value of the Labour forty Millions, that is 4 l. per Head.

But,

But it is to be noted, That about a Quarter of the Mass of Mankind are Children, Males and Females, under seven Years old, from whom little Labour is to be expected. It is also to be noted, that about another tenth Part of the whole People are such as, by Reason of their great Estates, Titles, Dignities, Offices, and Professions, are exempt from that Kind of Labour we now speak of; their Business being, or ought to be, to govern, regulate, and direct the Labours and Actions of others. So that of ten Millions, there may be about six Millions and an half, which (if Need require) might actually labour: And of these some might earn 3 s. *per Week*, some 5 s, and some 7 s. That is, all of them might earn 5 s. *per Week* at a Medium one with another; or at least 10 l. *per Annum*, (allowing for Sickness, and other Accidents;) whereby the whole might earn sixty five Millions *per Annum*, that is twenty five more than the Expence.

The Author of the State of *England* says that the Children of *Norwich*, between six and sixteen Years old, do earn 12000 l. *per Annum*, more than they spend. Now forasmuch as the People of *Norwich* are a three hundredth Part of all the People of *England*, as appears by the Accompts of the Hearth-money, and about a five hundredth Part of all the King's Subjects throughout the World; it follows that all his Majesty's Subjects between six and sixteen Years

old, may earn five Millions *per Annum* more than they spend.

Again, forasmuch as the Number of People above sixteen Years old, are double the Number of those between six and sixteen, and that each of the Men can earn double to each of the Children; it is plain that if the Men and Children every where did work as they do in *Norwich*, they might earn twenty five Millions *per Annum* more than they spend; which Estimate, grounded upon Matter of Fact and Experience, agrees with the former.

Although as hath been proved, the People of *England* do thrive, and that it is possible they might superlucrate twenty five Millions *per Annum*; yet it is manifest that they do not, nor twenty three, which is less by the two Millions herein meant; for if they did superlucrate twenty three Millions, then in about five or six Years Time, the whole Stock and personal Estate of the Nation would be doubled, which I wish were true, but find no Manner of Reason to believe; wherefore if they can superlucrate twenty five, but do not actually superlucrate twenty three, nor twenty, nor ten, nor perhaps five, I have then proved what was propounded; *viz.* That there are spare Hands among the King's Subjects to earn, at least, two Millions more than they do.

But to speak a little more particularly concerning this Matter, It is to be noted, that
since

Since the Fire of *London*. there was earned in four Years by Tradesmen (relating to Building only) the Sum of four Millions; *viz.* one Million *per Annum*, without lessening any other Sort of Work, Labour, or Manufacture, which was usually done in any other four Years before the said Occasion. But if the Tradesmen relating to Building only, and such of them only as wrought in and about *London*, could do one Million worth of Work extraordinary; I think that from thence, and from what hath been said before, all the rest of the spare Hands might very well double the same, which is as much as was propounded.

Now if there were spare Hands to superlucrate Millions upon Millions, they signify nothing unless there were Employment for them; and may as well follow their Pleasures and Speculations as labour to no Purpose; therefore the more material Point is, to prove that there is two Millions Worth of Work to be done, which at present the King's Subjects do neglect.

For the Proof of this there need little more to be done, than to compute 1. How much Money is paid by the King of *England's* Subjects to Foreigners for Freight of Shipping. 2. How much the *Hollanders* gain by their Fishing Trade practised upon our Seas. 3. What the Value is of all the Commodities imported into and spent in *England*, which might by Diligence be produced and manufactured here. To

make short of this Matter, upon Perusal of the most authentick Accompts relating to these several Particulars, I affirm that the same amounteth to above five Millions, whereas I propounded but two Millions.

For a further Proof whereof Mr. *Samuel Fortry* in his ingenious Discourse of Trade, exhibits the Particulars, wherein it appears, that the Goods imported out of *France* only, amount yearly to two Millions six hundred thousand Pounds. And I affirm, that the Wine, Paper, Cork, Rosin, Capers, and a few other Commodities which *England* cannot produce, do not amount to one fifth Part of the said Sum, From whence it follows, that (if Mr. *Fortry* hath not erred) the two Millions here mentioned may arise from *France* alone; and consequently five or six Millions from all the three Heads last above specified.

C H A P. IX.

That there is Money sufficient to drive the Trade of the Nation.

SINCE his Majesty's happy Restauration, it was thought fit to call in, and new coin, the Money which was made in the Times of Usurpation. Now it was observed by the general Consent of Cashiers, that the said Money (being by frequent Revolutions well mixed with old)

old) was about a seventh Part thereof; and that the said Money being called in, was about Eight hundred thousand Pounds, and consequently the Whole five Millions six hundred thousand Pound. Whereby it is probable that (some Allowance being given for hoarded Money) the whole Cash of *England* was then about six Millions, which I conceive is sufficient to drive the Trade of *England*, not doubting but the rest of his Majesty's Dominions have the like Means to do the same respectively.

If there be six Millions of Souls in *England*, and that each spendeth 7 *l. per Annum*, then the whole Expence is forty two Millions, or about Eight hundred thousand Pound *per Week*; and consequently, if every Man did pay his Expence weekly, and that the Money could circulate within the Compass of a Week, then less than one Million would answer the Ends proposed. But forasmuch as the Rents of the Lands in *England* (which are paid half-yearly) are eight Millions *per Annum*, there must be four Millions to pay them. And forasmuch as the Rent of the Housing of *England*, paid quarterly, are worth about four Millions *per Annum*, there needs but one Million to pay the said Rents; wherefore six Millions being enough to make good the three Sorts of Circulations above mentioned, I conceive what was proposed is competently proved, at least
until

until something better be advanced to the contrary.

C H A P. X.

That the King of England's Subjects have Stock competent and convenient to drive the Trade of the whole commercial World.

NOW for the further Encouragement of Trade, as we have shewn that there is Money enough in *England* to manage the Affairs thereof; so we shall now offer to Consideration, whether there be not a competent and convenient Stock to drive the Trade of the whole commercial World. To which Purpose it is to be remember'd, that all the Commodities yearly exported out of every Part of the last mentioned World, may be bought for forty five Millions; and that the Shipping employed, in the same World are not worth above fifteen Millions more, and consequently, that sixty Millions at most, would drive the whole Trade above mentioned, without any Trust at all. But forasmuch as the Growers of Commodities do commonly trust them to such Merchants or Factors as are worth but such a Part of the full Value of their Commodities as may possibly be lost upon the Sale of them, whereas Gain is rather to be expected; it follows that less than a Stock of Sixty Millions, nay less than Half of the same Sum, is sufficient to drive the Trade
above

above mentioned: It being well known that any Tradesman of good Reputation, worth Five hundred Pounds, will be trusted with above One thousand Pounds Worth of Commodities: Wherefore less than thirty Millions will suffice for the said Purpose; of which Sum the Coin, Shipping, and Stock, already in Trade, do at least make one Half.

And it hath been shewn how by the Policy of a Bank, any Sum of Money may be made equivalent in Trade, unto near double of the same; by all which it seems, that even at present much is not wanting to perform what is propounded. But suppose twenty Millions or more were wanting, it is not improbable, that since the Generality of Gentlemen, and some Noblemen, do put their younger Sons to Merchandize, they will see it reasonable, as they increase in the Number of Merchants, so to increase the Magnitude of Trade, and consequently to increase Stock; which may effectually be done by imbanking twenty Millions Worth of Land, not being above a Sixth or Seventh of the whole Territory of *England*; (that is to say) by making a Fund of such Value, to be Security for all Commodities bought and sold upon the Account of the universal Trade here mentioned.

And thus it having appeared, that *England* having in it as much Land, like *Holland* and *Zeland*, as the said two Provinces do themselves

contain, with Abundance of other Land not inconvenient for Trade, and that there are spare Hands enough to earn many Millions of Money more than they now do, and that there is also Employment to earn several Millions (even from the Consumption of *England* itself) it follows from thence, and from what hath been said in the last Paragraph, about enlarging of Stock both of Money and Land, that it is not an impossible, nay a very feasible Matter, for the King of *England's* Subjects to gain the universal Trade of the whole commercial World.

Nor is it unseasonable to intimate this Matter, forasmuch as the younger Brothers of the good Families of *England* cannot otherwise be provided for, so as to live according to their Birth and Breeding: For if the Lands of *England* are worth eight Millions *per Annum*, then there be at a Medium about ten thousand Families of about 800 *l. per Annum*; in each of which, one with another, we may suppose there is a younger Brother, whom less than two or three hundred Pounds *per Annum* will not maintain suitable to his Relations: Now I say that neither the Offices at Court, nor Commands in our ordinary Army and Navy, nor Church Preferments, nor the usual Gains by the Profession of the Law and Physick, nor the Employments under Noblemen and Prelates, will, all of them put together, furnish

with Livelihoods of above 300 *l. per Annum*, to three Thousand of the said ten Thousand younger Brothers: Wherefore it remains that Trade alone must supply the rest. But if the said seven thousand Gentlemen be applied to Trade, without increasing of Trade, or if we hope to increase Trade without increasing of Stock, which for ought appears is only to be done by imbanking a due Proportion of Lands, and Money, we must necessarily be disappointed. Where note, that selling of Lands to Foreigners for Gold and Silver, would enlarge the Stock of the Kingdom. Whereas doing the same between one another, doth effect nothing: For he that turneth all his Land into Money, disposes himself for Trade; and he that parteth with his Money for Land, doth the contrary: But to sell Land to Foreigners, increaseth both Money and People, and consequently Trade. Wherefore it is to be thought, that when the Laws denying Strangers to purchase, and not permitting them to trade, without paying extraordinary Duties, were made; that then the publick State of Things, and Interest of the Nation were far different from what they now are.

Having handled these ten principal Conclusions, I might go on with others *ad infinitum*; but what hath been already said I look upon as sufficient to shew what I mean by *Political Arith-*

Arithmetick; and to shew the Uses of knowing the true State of the People, Land, Stock, Trade, &c. 2. That the King's Subjects are not in so bad a Condition as discontented Men would make them. 3. To shew the great Effect of Unity, Industry, and Obedience, in Order to the common Safety, and each Man's particular Happiness.

F I N I S.

BOOKS printed for, and sold by D. BROWNE,
without Temple-Bar, and J. WHISTON and
B. WHITE, in Fleet-Street.

F O L I O.

A COLLECTION of State Papers, relating
to Affairs in the Reigns of *Henry VIII. Ed-
ward VI. Q. Mary,* and *Q. Elizabeth,* to the
Year 1570, never before publish'd; transcribed
from the Originals left by *William Cecil Lord Burleigh,* and
now in the Library of the Right Hon. the Earl of *Salisbury.*
By *Samuel Haynes,* D. D. late Rector of *Hatfield,* and
Canon of *Windfor.* Price 18s. neatly bound.

2. Tables of antient Coins, Weights and Measures, ex-
plain'd and exemplify'd in several Dissertations.

By *JOHN ARBUTHNOT,* M. D.

Fellow of the Royal Society and College of Physicians.
To which is added, An Appendix, containing Observa-
tions on Dr. *Arbuthnot's* Dissertations on Coins, Weights,
and Measures. By *Benj. Langwith,* D. D. The second Edi-
tion. Price 18s. neatly bound.

3. An Historical Account of the *British* Trade over the
Caspian Sea: With the Author's Journal of Travels from
England, through *Russia* into *Persia*; and back through
Russia, Germany, and *Holland.* To which are added, The
Revolutions of *Persia* during the present Century; with the
particular History of the great Usurper *Nadir Kouli.*

By *JONAS HANWAY,* Merchant.

The second Edition, revised and corrected; printed on a
fine Paper, in two large Volumes; illustrated with Maps
and Copper-plates. Price 11. 10s. bound.

4. EXAMEN; or, An Enquiry into the Credit and Ve-
racity of Bishop *Kennet's* History of *England,* shewing the
many Falsities contain'd therein: Together with authentick
Memoirs of the Reign of *K. Charles II* displaying the
secret Transactions of those Times; also true Characters
of all the Persons eminent in Church and State. Price
bound 12s. ——— The Lives of the three Honourable
Brothers: 1. *Francis North,* Baron of *Guilford,* Lord
Keeper

Books printed for, &c.

Keeper of the Great Seal, under *K. Charles* and *James II.* containing, besides many difficult Law Cases determin'd by him, *Memoirs* of *Sir Matthew Hale*, *Sir George Jefferies*, *Sir Leoline Jenkins*, *Sir Orlando Bridgman*, *Sir William Scroggs*, Lord Chief Justice *Saunders*, Serjeant *Maynard*, and other eminent Lawyers and Statesmen in his Time. 2. *The Life* of *Sir Dudley North*, Knt. an eminent *Turky* Merchant; with curious Observations made by him during his long Residence at *Smyrna* and *Constantinople*, on the *Turkish* Trade, Laws, Religion, Customs, and Government. 3. Reverend Dr. *John North*, Master of *Trinity* College, *Cambridge*, with literary *Memoirs* and Observations made by him. Price bound 12s.

O C T A V O.

5. *The CASE* of *Ireland's* being bound by Acts of Parliament in *England*, stated. By *William Mollineux*, of *Dublin*, Esq; To which is added, *The CASE* of *TENURES* upon the Commission of defective Titles, argued by all the Judges of *Ireland*; with their Resolutions, and the Reasons of them. Price 2s. few'd.

6. A Collection of Tracts, concerning the present State of *Ireland*; with respect to its Riches, Revenue, Trade, and Manufactures. Price 1s. 6d. few'd.

D U O D E C I M O.

7. *England's* GAZETTEER; or, An accurate Description of all the Cities, Towns, and Villages of the Kingdom; in three Volumes. Vol. I. and II. contain a Dictionary of the Cities, Corporations, and Market Towns, and the most noted Villages, their Manufactures and Trade, Markets, Fairs, Customs and Privileges, principal Buildings, and charitable Foundations; with their Distances from *London*, in Miles, both computed and measured. Vol. III. A new *Index Villaris*, or Alphabetical Register of the less noted Villages; with their Distance or Bearing from the next Market Town, or well known Place. Price 9s. bound.

8. *The British Merchant*. Compos'd by a Body of Merchants. In three neat Pocket Volumes. Price 9s. bound.

iv *DEDICATION.*

promote Arts and Sciences, especially those called Mathematical; in a constant Benevolence to all Mankind, particularly to those who study the Good of Society; and in a regular Discharge of all the important Duties of Life, is truly his Successor.

I can have no Pretence to seek, elsewhere, for a Patron to this Third Edition, which the Demand I have met with for the Copies, and some typographical Errors, heretofore overlooked, have rendred necessary; and therefore I again trespass on your
Lord-

DEDICATION. v

Lordship's Indulgence in this Address, well knowing, that your usual Candour and Goodness will excuse any Imperfections that may still remain in the Performance of

MY LORD,

Your Lordship's

most Obedient, and

most humble Servant,

A. DE MOIVRE.

P R E F A C E.

DR. *Halley* published in the *Philosophical Transactions*, N^o. 196. an Essay concerning the Valuation of Lives; it was partly built upon five Years Observation of the Bills of Mortality taken at *Breslaw*, the Capital of *Silesia*, and partly on his own Calculation.

Altho' he had thereby confirm'd the great Opinion which the World entertain'd of his Skill and Sagacity, yet he was sensible, that his Tables and Calculations were susceptible of farther Improvements; of this he express'd his Sense, in the following Words; *Were this Calculus founded on the Experience of a very great Number of Years, it would very well be worth the while, to think of Methods to facilitate the Computation of two, three, or more Lives.*

From

From whence it appears, that the Table of Observations being only the Result of a few Years Experience, it was not so entirely to be depended upon, as to make it the Foundation of a fix'd and unalterable Valuation of Annuities on Lives; and that even admitting such a Table could be obtain'd, as might be grounded on the Experience of a great Number of Years, still the Method of applying it to the Valuation of several Lives, would be extremely laborious, considering the vast Number of Operations, that would be requisite to combine every Year of each Life with every Year of all the other Lives.

The Subject of Annuities on Lives, had been long neglected by me, partly prevented by other Studies, partly wanting the necessary means to treat of it as it deserved: But two or three Years after the Publication of the first Edition of my *Doctrine of Chances*, I took the Subject into consideration; and consulting Dr. *Halley's* Table of Observations, I found that the Decrements of Life, for considerable Intervals of Time, were in Arithmetic Progression; for Instance, out of 646 Persons of twelve Years of Age, there remain 640 after one Year; 634 after two Years; 628, 622, 616, 610, 604, 598, 592, 586, after 3, 4, 5, 6, 7, 8, 9, 10 Years respectively, the common Difference of those Numbers being 6.

Exa-

Examining afterwards other Cases, I found that the Decrements of Life for several Years were still in Arithmetic Progression; which, may be observed from the Age of 54, to the Age of 71, where the Difference for 17 Years together, is constantly 10.

After having thoroughly examined the Tables of Observation, and discovered that Property of the Decrements of Life, I was inclined to compose a Table of the Values of Annuities on Lives, by keeping close to the Tables of Observation; which would have been done with Ease, by taking, in the whole Extent of Life, several Intervals whether equal or unequal: However, before I undertook the Task, I tried what would be the Result, of supposing those Decrements uniform from the Age of Twelve; being satisfied that the Excesses arising on one side, would be nearly compensated by the Defects on the other; then comparing my Calculation with that of *Dr. Halley*, I found the Conclusion so very little different, that I thought it superfluous to join together several different Rules, in order to compose a single one: I need not take Notice, that from the Time of Birth to the Age of Twelve, the Probabilities of Life increase, rather than decrease, which is a Reason of the apparent Irregularity of the Tables in the beginning.

Another thing was necessary to my Calculation, which was, to suppose the Extent of Life confin'd to a certain Period of Time, which I supposed to be at 86 : What induced me to assume that Supposition was, 1st, That Dr. *Halley* terminates his Tables of Observations at the 84th Year ; for altho' out of 1000 Children of one Year of Age, there are twenty, who, according to Dr. *Halley's* Tables, attain to the Age of 84 Years, which Number of 20, is inconsiderable, and would still have been reduced, if the Observations had been carried two Years farther. 2^d. It appears from the Tables of *Graunt*, who printed the first Edition of his Book above 80 Years ago, that out of 100 new-born Children, there remain'd not one after 86 Years ; this was deduced from the Observations of several Years, both in the City and the Country, at a Time when the City being less populous, there was a greater Facility of coming at the Truth, than at present. 3^d. I was farther confirm'd in my Hypothesis, by Tables of Observation made in *Switzerland*, about the Beginning of this Century, wherein the Limit of Life is placed at 86 ; As for what is alledged, that by some Observations of late Years, it appears, that Life is carried to 90, 95, and even to 100 Years ; I am no more moved by it, than by the Examples of *Parr*, or *Jenkins*, the first of which lived 152 Years, and the other 167.

To

P R E F A C E. xi

To this may be added, that the Age of purchasing Annuities for Life, seldom exceeds 70, at which Term, Dr. *Halley* ends his Tables of the Valuation of Lives.

The greatest Difficulty that occurred to me in this Speculation, was to invent practical Rules that might easily be applied to the Valuation of several Lives; which, however, was happily overcome, the Rules being so easy, that by the Help of them, more can be perform'd in a Quarter of an Hour, than by any Method before extant, in a Quarter of a Year.

Since the Publication of my First Edition, which was in 1724, I made some Improvements to it, as may be seen in the Second Edition of my *Doctrine of Chances*; but this Edition of Annuities has many Advantages over the former, and that in respect to the Disposition of the Precepts, the Conciseness of the Rules, the Multiplicity of Problems, and Usefulness of the Tables I have invented.

Before I make an End of this Preface, I think it proper to observe, that altho' I have given Rules for finding the Value of Annuities for any Rate of Interest, yet I have confined myself in my Tables, to the several Rates of 4, 5 and 6 *per Cent.* which may be interpreted, as if I thought reasonable, that when Land
† scarce

scarce produces three and a half *per Cent.* and South-Sea Annuities barely that Interest, yet the Purchaser of an Annuity should make 4 *per Cent.* or above ; but those Cases can hardly admit of Comparison, it being well known, that Land in Fee-simple, procures to the Proprietor Credit, Honour, Reputation, and other Advantages, in consideration of which, he is contented with a smaller Income. As to the Value of South-Sea Annuities, it has its Foundation on the Punctuality of Payments, and on a Parliamentary Security ; but Annuities on Lives, have not the former Security, and seldom the latter.

T H E

THE
VALUATION
OF
ANNUITIES
ON
LIVES.

BEFORE I come to the Solution of Questions on Lives, it will be necessary to explain the Meaning of some Words which I shall often have occasion to mention.

I°. SUPPOSING the *Probabilities of Life* to decrease in Arithmetic Progression in such manner, as that supposing, for Instance, 36 Persons each of
B the

2 *Of* ANNUITIES

the Age of 50, if after one Year expired there remains but 35, after two 34, after three 33, and so on; it is very plain that such Lives would necessarily be extinct in 36 Years, and that therefore the *Probabilities of living* 1, 2, 3, 4, 5, &c. Years from this Age of 50 would fitly be represented by the Fractions $\frac{35}{36}$, $\frac{34}{36}$, $\frac{33}{36}$, $\frac{32}{36}$, $\frac{31}{36}$, &c. which decrease in Arithmetic Progression.

I will not say that the Decrements of Life are precisely in that Proportion, still comparing that Hypothesis with the Table of Dr. *Halley*, from the Observations made at *Breslaw*, they will be found to be exceedingly approaching.

2°. I call that the *Complement of Life*, which remains from the Age given, to the Time of the Extinction of Life, which will be at 86, according to our Hypothesis. Thus supposing an Age of 50, because the Difference between 50 and 86 is 36, I call 36 the *Complement of Life*.

3°.

3°. I call that the *Rate of Interest*, which is properly the Amount of one Pound, put out at Interest for one Year, otherwise one Pound joined with the Interest it produces in one Year; thus supposing Interest at 5 *per Cent.* the Interest of 1 *l.* would be 0.05, which being joined to the Principal 1, produces 1.05, which is what I call the *Rate of Interest*.

PROBLEM I.

Supposing the Probabilities of Life to decrease in Arithmetic Progression, to find the Value of an Annuity upon a Life of an Age given.

SOLUTION.

LET the Rent or Annuity be supposed = 1, the Rate of Interest = r , the Complement of Life = n , the Value of an Annuity certain to continue during n Years = P , then will the

Value of the Life be $\frac{1 - \frac{r}{r-1} P}{r-1}$, which is thus expressed in Words at length;

Take the Value of an Annuity certain for so many Years, as are denoted
 B 2 by

4 Of ANNUITIES

by the Complement of Life; multiply this Value by the Rate of Interest, and divide the Product by the Complement of Life, then let the Quotient be subtracted from Unity, and let the Remainder be divided by the Interest of 1 l. then this last Quotient will express the Value of an Annuity for the Age given.

THUS suppose it were required to find the present Value of an Annuity of 1 l. for an Age of 50, Interest being at 5 per Cent.

THE Complement of Life being 36, let the Value of an Annuity certain, according to the given Rate of Interest, be taken out of the Tables annexed to this Book, this Value will be found to be 16.5468.

LET this Value be multiplied by the Rate of Interest 1.05, the Product will be 17.3741.

LET this Product be divided by the Complement of Life, viz. by 36, the Quotient will be 0.04826.

SUB-

SUBTRACT this Quotient from Unity, the Remainder will be 0.5174.

LASTLY, divide this Quotient by the Interest of 1 *l.* viz. by 0.05, and the new Quotient will be 10.35; which will express the Value of an Annuity of 1 *l.* or how many Years Purchase the said Life of 50 is worth.

AND in the same manner, if Interest of Money was at 6 *per Cent.* an Annuity upon an Age of 50, would be found worth 9.49 Years Purchase.

BUT as I have annexed to this Treatise the Values of Annuities for an Interest of 4, 5, and 6 *per Cent.* it will not be necessary to calculate those Cases, but such only as require a Rate of Interest higher or lower, or intermediate; which will seldom happen, but in case it does, the Rule may easily be applied.

PROBLEM II.

The Values of two single Lives being given, to find the Value of an Annuity granted for the Time of their joint continuance.

6 Of ANNUITIES

SOLUTION.

LET M be the Value of one Life, P the Value of the other, r the Rate of Interest; then the Value of an Annuity upon the two joint Lives will be

$\frac{MP}{M + P - r - IMP}$, in Words thus;

Multiply together the Values of the two Lives, and reserve the Product.

Let that Product be again multiplied by the Interest of 1 l. and let that new Product be subtracted from the Sum of the Values of the Lives, and reserve the Remainder.

Divide the first Quantity reserved by the second, and the Quotient will express the Value of the two joint Lives.

THUS, supposing one Life of 40 Years of Age, the other of 50, and Interest at 5 per Cent. The Value of the first Life will be found in the Tables to be 11.83, the Value of the second 10.35, the Product will be 122.4405, which Product must be reserved.

MUL-

MULTIPLY this again by the Interest of 1 l. viz. by 0.05, and this new Product will be 6.122025.

THIS new Product being subtracted from the Sum of the Lives which is 22.18, the Remainder will be 16.057975, and this is the second Quantity reserved.

NOW dividing the first Quantity reserved by the second, the Quotient will be 7.62 nearly; and this expresses the Values of the two joint Lives.

IF the Lives are equal, the Canon for the Value of the joint Lives will be shortened and be reduced to $\frac{M}{2-r-1 \times M}$, which in words may be thus expressed;

Take the Value of one Life, and reserve that Value.

Multiply this Value by the Interest of 1 l. and then subtract the Product from the Number 2, and reserve the Remainder.

Divide the first Quantity reserved by the second, and the Quotient will express the Value of the two equal joint Lives.

THUS,

8 Of ANNUITIES

THUS, supposing each Life to be 45 Years of Age, and Interest at 5 *per Cent.*

THE Value of one Life will be found to be 11.14, the first Quantity reserved.

THIS being multiplied by 0.05 the Interest of 1 *l.* the Product will be 0.557.

THIS Product being subtracted from the Number 2, the Remainder will be 1.443, the second Quantity reserved.

DIVIDE the first Quantity reserved *viz.* 11.14; by the second, *viz.* 1.443, and the Quotient 7.72 will be the Value of the two joint Lives, each of 45 Years of Age.

PROBLEM III.

The Values of three single Lives being given, to find the Value of an Annuity for the Time of their joint continuance.

SOLUTION.

LET M , P , Q be the respective Values of the single Lives, then the
Values

Value of the three joint Lives will be

$\frac{MP^2}{MP + M^2 + P^2 - 2dMP^2}$, supposing d to represent the Interest of 1 l. in Words thus ;

Multiply the Values of the single Lives together, and reserve the Product.

Let that Product be multiplied again by the Interest of 1 l. and let the Double of that new Product be subtracted from the Sum of the several Products of the Lives taken two and two, and reserve the Remainder.

Divide the first Quantity reserved by the second, and the Quotient will be the Value of the three joint Lives.

THUS, supposing one Life to be worth 13 Years Purchase, the second 14, the third 15, and Interest at 4 per Cent ; the Product of the three Lives will be 2730, which being multiplied by the Interest of 1 l. viz. by 0.04, the new Product will be 109.20,

C whereof

10 *Of* ANNUITIES

whereof the double is 218.40: Now the Product of the first Life by the second is 182; the Product of the first Life by the third is 195; and the Product of the second Life by the third is 210, the Sum of all which is 587; from which subtracting the Number 218.40 found above, the Remainder will be 368.60, by which the Product of the three Lives, *viz.* 2730 being divided, the Quotient 7.41 will be the Value of the three joint Lives.

BUT if the three Lives were equal, the general Expression of the Value of the joint Lives will be much shorter, for let M represent the Value of one Life, d the Interest of 1 *l.* then the Value of the three joint Lives will be $\frac{M}{3-2dM}$, in Words thus;

*Take the Value of one Life, and reserve it, multiply this Value by the Interest of 1 *l.* and double the Product.*

Sub-

Subtract this double Product from the Number 3, and reserve the Remainder.

Divide the first Quantity reserved by the second, and the Quotient will be the Value of the three joint Lives.

THUS, supposing three equal Lives each worth 14 Years Purchase, reserve the Number 14.

MULTIPLY this by 0.04, Interest of 1%. the Product will be 0.56, which being doubled, will be 1.12.

THIS being subtracted from the Number 3, the Remainder will be 1.88 which is the second Quantity to be reserved.

DIVIDE 14 first Quantity reserved by the second 1.88, and the Quotient 7.44 will be the Value of the three joint Lives.

FROM the two last Examples it appears, that in estimating the Values of joint Lives, it would be an Error to suppose that they might be reduced

12 *Of* ANNUITIES

to an Equality, by taking a Mean Life betwixt the longest and shortest, for altho' 14 is a Medium betwixt 13 and 15, yet an Annuity upon those three joint Lives was found to be 7.41, whereas supposing them to be each 14 Years Purchase, the Value is 7.44; it is true that the Difference is so small, that it might be neglected, yet this arises meerly from a near Equality in the Lives, for if there had been a greater Inequality, the Conclusion would have considerably varied.

BEFORE I come to the fourth Problem, I think it proper to explain the Meaning of some Notations which I make use of, in order to be as clear and concise as I can.

I denote the Values of an Annuity upon two joint Lives, whose single Values are M and P by \overline{MP} , which ought carefully to be distinguished from the Notation MP ; this last denoting barely the Product of one Value multiplied by the other, whereas

\overline{MP}

\overline{MP} stands for what was denoted in our second Problem by $\frac{MP}{M+P-r-iMP}$.

IN the same manner, the Value of an Annuity upon the three joint Lives whose single Values are M, P, Q , is denoted by \overline{MPQ} , which is equivalent to what has been expressed in the third Problem by $\frac{MPQ}{MP+MQ+PQ-2dMPQ}$.

THIS being premised, I proceed to the fourth Problem.

PROBLEM IV.

The Values of two single Lives being given, to find the Value of an Annuity upon the longest of them, that is, to continue so long as either of them is in being.

SOLUTION.

LET M be the Value of one Life, P the Value of the other, \overline{MP} the Value of the two joint Lives, then the Value

14 Of ANNUITIES

Value of the longest of the two Lives will be $M+P-\overline{MP}$. In Words thus ;

From the Sum of the Values of the single Lives, subtract the Value of the joint Lives, and the Remainder will be the Value of the longest.

LET us suppose two Lives, one worth 13 Years Purchase, the other 14, and Interest at 4 *per Cent*. The Sum of the Values of the Lives is 27, the Value of the two joint Lives by the Rules before given, will be found 9.23. Now, subtracting 9.23 from 27, the Remainder 17.77 is the Value of the longest of the two Lives.

IF the two Lives are equal, the Operation will be something shorter.

BUT it is proper to observe in this place, that several equal Lives are concerned in an Annuity, I commonly denote one single Life by M' , two joint Lives by M'' , three joint Lives by M''' , and so on ; so that the Rule for an Annuity

nuity to be granted till such Time as either of the equal Lives is in being may be expressed by $2 M' - M''$.

PROBLEM V.

The Values of three single Lives being given, to find the Value of an Annuity upon the longest of them.

SOLUTION.

Let M, P, Q , be the Values of the single Lives, $\overline{MP}, \overline{MQ}, \overline{PQ}$, the Values of all the joint Lives combined two and two, \overline{MPQ} the Value of the three joint Lives, then the Value of an Annuity upon the longest of them is $M + P + Q - \overline{MP} - \overline{MQ} - \overline{PQ} + \overline{MPQ}$, in Words thus ;

Take the Sum of the three single Lives, from which Sum subtract the Sum of all the joint Lives combined two and two, then to the Remainder add the Value of the three joint Lives, and the Result will be the Value of the longest of the three Lives.

THUS

16 Of ANNUITIES

THUS supposing the single Lives to be 13, 14, and 15 Years Purchase, the Sum of the Values will be 42; the Values of the first and second joint Lives is 9.23, of the first and third 9.65, of the second and third 10.18, the Sum of all which is 29.06, which being subtracted from the Sum of the Lives found before, *viz.* 42, the Remainder will be 12.94, to which adding the Value of the three joint Lives 7.41, the Sum 20.35 will be the Value of the longest of the three joint Lives.

BUT if the three Lives are equal, the Rule for the Value of the Life that remains last is $3M' - 3M'' + M'''$.

OF REVERSIONS.

PROBLEM VI.

Suppose A is in Possession of an Annuity, and that B after the Decease of A is to have the Annuity for him, and his Heirs for ever, to find the present Value of the Reversion.

SOLU-

ON LIVES. 17
SOLUTION.

LET M be the Value of the Life in Possession, r the Rate of Interest, then the present Value will be $\frac{1}{r-1} - M$, that is, *from the Value of the Perpetuity, subtract the Value of the Life in Possession, and the Remainder will be the Value of the Reversion.*

THUS, Supposing that A is 50 Years of Age, an Annuity upon his Life, Interest at 5 per Cent. would be 8.39, which being subtracted from the Perpetuity 20, the Remainder will be 11.61, which is the Present Value of the Expectation of B .

IN the same manner, supposing that C were to have an Annuity for him and his Heirs for ever, after the Lives of A and B , then from the Perpetuity Subtracting the Value of the longest of the two Lives of A and B , the Remainder will express the Value of C 's Expectation.

THUS, Supposing the Ages of A and B be 40 and 50, the Value of an Annuity upon the longest of these two

D Lives

18 Of ANNUITIES

Lives would be found by the 4th Problem, to be 12.56; and this being subtracted from the Perpetuity 20, the Remainder is 7.44, which is the Value of *C*'s Expectation, and the Rule will be the same in any other case that may be proposed.

PROBLEM VII.

Supposing that A is in Possession of an Annuity for his Life, and that B after the Life of A, should have an Annuity for his Life only; to find the Value of the Life of B after the Life of A.

THIS Case ought carefully to be distinguished from the Case of the 6th Problem; for in that Problem, altho' the Expectant *B* should die before *A*, still the Heirs of *B* have the Reversion; but in the Case of the present Problem, if *B* dies before *A*, the Heirs of *B* have no Expectation.

SOLUTION.

LET *M* be the Value of the Life of the present Possessor, *P* the Value of the
the

the Life of the Expectant, then the Value of his Expectation is $P - \overline{MP}$. In Words thus ;

From the present Value of the Life of B, subtract the present Value of the joint Lives of B and A, and the Remainder will be the Value of B's Expectation.

THE Reason of which Operation is very plain, for if *B* were now to begin to receive the Annuity, it would be worth to him the Sum *P* in present Value ; but as he is to receive nothing during the joint Lives of himself and *N*, the present Value of their two joint Lives ought to be subtracted from the Value of his own Life.

PROBLEM VIII.

To find the Value of one Life after two.

Thus, Suppose A in Possession of an Annuity for his Life, that B is to have his Life in it after A, and that C is likewise to have his Life in it after B, butso that B dying before A, C succeeds A immediately; to find the Value of C's Expectation.

20 Of ANNUITIES

SOLUTION.

LET M , P , Q , be the respective Values of the Lives of A , B , C , then the Value of C 's Expectation is

$$Q - \frac{M Q}{P} + \frac{M P Q}{P Q}, \text{ which in Words}$$

is thus expressed ;

From the present Value of the Life of C, subtract the Sum of the joint Lives of himself and A, and of himself and B, and to the Remainder add the Sum of the three joint Lives, and the Result of these Operations will express the present Value of the Expectation of C.

PROBLEM IX.

If A, B, C agree among themselves to buy an Annuity to be by them equally divided, whilst they live together, then after the Decease of one of them, to be equally divided between the two Survivors, then to belong entirely to the last Survivor for his Life ; to find what each

each of them ought to contribute towards the Purchase.

SOLUTION.

LET M , P , Q be the respective Value of the Lives of A , B , C , then what A is to contribute, is

$$M - \frac{1}{2} \overline{MP} + \frac{1}{3} \overline{MPQ} - \frac{1}{2} \overline{MQ}$$

What B is to contribute, is

$$P - \frac{1}{2} \overline{PM} + \frac{1}{3} \overline{MPQ} - \frac{1}{2} \overline{PQ}$$

What C is to contribute, is

$$Q - \frac{1}{2} \overline{QM} + \frac{1}{3} \overline{MPQ} - \frac{1}{2} \overline{QP}$$

In Words thus; *From the Value of the Life of A, subtract the half Sum of the Values of the joint Lives of himself and B, and of himself and C, and to the Remainder add $\frac{1}{3}$ of the Value of the three joint Lives, and the Sum will be what*

22 Of ANNUITIES

what A is to contribute towards the Purchase.

IN like manner, from the Value of *B*'s Life subtract the half Sum of the Values of the joint Lives of himself and *A*, and of himself and *C*, and to the Remainder add $\frac{1}{3}$ of the Value of the three joint Lives, and the Sum will be what *B* is to contribute.

AND again, from the Value of the Life of *C*, subtract the half Sum of the Values of himself and *A*, and of himself and *B*; then to the Remainder add $\frac{1}{3}$ of the Values of the three joint Lives, and this last Operation will shew what *C* is to contribute.

PROBLEM X.

Supposing three equal Lives of any Age given, for Instance 30, and that upon the Failing of any one of them, that Life shall be immediately replaced, and I then receive a Sum I agreed upon, and that to perpetuity for me and my Heirs; what is the present Value

lue of that Expectation, and at what Intervals of Time, one with another, may I expect to receive the said Sum.

SOLUTION.

IMAGINE that there is an Annuity of 1 *l.* to be received as long as the three Lives are in being, and that the Present Value is M^m . which Symbol we make use of to represent the Present Value of an Annuity upon three equal joint Lives; now, since each Life is supposed to be 30 Years of Age, and that the Rate of Interest is 5 *per Cent.* we shall find, by following the Directions of the 3^d Problem, that the Present Value of the three joint Lives is $7.64 = M^m$; this being fixed, the Present Value of all the Payments to be made to Eternity at equal Intervals of Time, will be $\frac{1-dM^m}{dM^m} \times \int$, where the Quantity d signifies the Interest of 1 *l.* In Words thus;

Multiply the Present Value of the three joint Lives, viz. 7.64 by the Interest of
of

24 Of ANNUITIES

of 1 l. which in this Case is 0.05, and that Product, which is 0.382, must be reserved.

Subtract this Quantity from Unity, and the Remainder, viz. 0.618 being divided by the Quantity reserved, the Quotient will be 1.62, and this being multiplied by the Sum 1, which we may suppose 100 l. the Product will be 162 l. and this is the present Value of all the Payments that will be made to Eternity, at equal Intervals of Time upon the failing of a Life, which is to be immediately replaced.

As for the Intervals of Time after which those Replacements will be made, they may be found thus ;

Look in the second of our Tables for the Number 7.64, which is the Value of the three joint Lives, and over against it will be found the Number answering, which is between 9 and 10 ; and so it may be said that the Replacements will be made at every Interval of about 9 or 10 Years.

BUT

BUT that Interval may be determined a little more accurately, by help of a Table of Logarithms, by taking the Logarithm of the Quantity $\frac{1}{1-dM^n}$ and dividing it by the Logarithm of r .

THE Logarithm of $\frac{1}{1-dM^n}$ is 0.2090115; the Logarithm of r is 0.0211893; and the first being divided by the second, the Quotient is 9.86, which shews that the Replacements will be made at Intervals a little more than $9\frac{3}{4}$ Years.

PROBLEM XI.

Supposing, as before, three equal Lives of 30, and that the Lives are not to be renewed, till after the failing of any two of them, and that a Sum p is then to be received, and that perpetually, after the failing of two Lives, what is the present Value of that Expectation.

SOLUTION.

MAKE $3M' - 2M'' = A$, let the Interest of 1 *l.* be $= d$, then the present

E sent

26 Of ANNUITIES

sent Value of that Expectation will be $\frac{1-dA}{dA} \times p$.

BUT to know the Intervals of Time after which the Lives will be filled up, take the Logarithm of the Quantity $\frac{1}{1-dA}$ and divide it by the Logarithm of r .

THE Value of a single Life of 30, Interest at 5 *per Cent.* is found in our Tables to be 13 Years Purchase, the Value M'' of two joint Lives by Problem II. is 9.83; and the Value M'' of three joint Lives by Problem III. is 7.85; then $3M'' - 2M''$, or the Difference between the Triple of two joint Lives, and the Double of two joint Lives will be $13.59 = A$, then $\frac{1-dA}{dA} \times p$ will be found to be 0.473 p , and the Intervals of Time will be 23.32, that is, nearly $23\frac{1}{3}$ Years.

PROBLEM XII.

Supposing still the Lives to be 30, and that they are not to be renewed till after the Extinction of all three, and

and that a Sum q is then to be received, and that perpetually after every Renewal, what is the present Value of that Expectation?

SOLUTION.

MAKE $3M' - 3M'' + M''' = B$, then the present Value of that Expectation will be $\frac{1-dB}{dB} \times q$; here B will be found to be 17.84, and consequently $\frac{1-dB}{dB} \times q$ will be $= 0.121 \times q$.

AND the Intervals of Time will be the Logarithm of the Quantity $\frac{1}{1-dB}$ divided by the Logarithm of r , which in this Case would be 45.62, that is, nearly $45\frac{3}{5}$ Years.

COROLLARY.

HENCE it will be easy to the Proprietor of the Lives, to find which is most advantageous to him, to fill up a Life as soon as it is vacant, or not to fill up before the Vacancy of two, or to let them all drop before the Renewal.

REMARK.

IT is not to be imagined that if Interest of Money was higher or lower than 5 *per Cent.* the Intervals of Time after which the Renewals are made, would be the same as they are now, for it will be found, that as Interest is higher, the Intervals will be shorter ; and as it is lower, so the Intervals will be longer ; yet one might make it an Objection to our Rules, that the length of Life would thereby seem to depend upon the Rate of Interest. To answer this Difficulty, it must be observed, that the calculating of Time imports no more, than that considering the Circumstances of the Purchaser and the Proprietor of the Lives, in respect to the Rate of Interest agreed upon, and the Sum to be given upon the Renewal of a Life, or Lives, the Proprietor makes the same Advantage of his Money, as if he had agreed with the Purchaser, that he should pay him a certain Sum of Money at equal Intervals

vals of Time, for redeeming the Risque which he the Purchaser runs of paying that Sum when the Life or Lives drop, but the real Intervals of Time will be shewn afterwards.

ALTHO' it seldom happens that in Contracts about Lives, any more than three are concern'd, yet I hope it will not be displeasing to our Readers to have this Speculation carry'd a little farther.

BUT as general Rules are best inculcated by particular Examples, I shall take the Case of five Lives, and express the several Circumstances of them in such manner, as that they may be a sure Guide to all other Cases of the same kind, let the Number of Lives be what it will; let therefore the following Expressions be written,

$$\begin{aligned}
 & M''' \\
 & 5 M'' - 5 M''' \\
 & 10 M'' - 15 M''' + 6 M'''' \\
 & 10 M'' - 20 M'' + 15 M''' - 4 M'''' \\
 & 5 M' - 10 M'' + 10 M''' - 5 M'''' + 1 M''''
 \end{aligned}$$

The

30 Of ANNUITIES

THE first Term M'' represents properly the present Value of an Annuity upon five equal joint Lives, but from thence may be deduced the Time of their joint continuance, or the Time in which it may be expected that one of them will fail, it being as I have said before, the Logarithm of $\frac{1}{1-dM''}$ divided by the Logarithm of r , however for shortness sake, I call for the present that Expression the Time.

THE two next Terms $5M'' - 4M'''$ represents the Time in which two of the Lives will fail.

THE three next Terms $10M'' - 15M''' + 6M''''$, represent the Time in which three out of the five Lives will fail.

THE four next $10M'' - 20M''' + 15M'''' - 4M'''''$, represent the Time in which four out of the five Lives will fail.

THE five next $5M'' - 10M''' + 10M'''' - 5M''''' + 1M''''''$, represent the
Time

Time in which all the five Lives will be extinct.

Now the Law of the Generation of the Co-efficients is thus.

1°. TAKE all the Terms which are affected with the Mark M''' , beginning from the uppermost, the Co-efficients $1-4+6-4+1$, which are the Terms of the Binomial $1-1$, rais'd to the fourth Power, which is less by one, than the Number of Lives concerned.

2°. TAKE the Terms which are affected with the Mark M'' , and prefix to them in order, the Product of the Number 5 by the Co-efficients $1-3+3-1$, which are the Terms of the Binomial $1-1$ raised to its Cube, that is, to a Power less by two than the Number of Lives concerned.

3°. TAKE all the Terms which are affected with the Mark M' , and prefix to them in order, the Product of the Number 10, multiplied by the Co-efficients $1-2+1$, which are the Terms of the Binomial $1-1$ raised to its Cube, that is, to a Power less by three,

32 Of ANNUITIES

three, than the Number of Lives concerned.

4°. TAKE all the Terms which are affected with the Mark M' , and prefix to them the Product of the Number 10, multiplied by the Terms of the Binomial $1-1$, raised to the Power whose Index is 1, that is to a Power less by four, than the Number of Lives concerned.

5°. TAKE all the Terms which are affected with the Mark M' , and prefix to them the Product of the Number 5, multiplied by the Binomial $1-1$, raised to a Power less by 5 than the Number of Lives concerned, which in this Case happening to be nothing, or 0, degenerates barely into Unity.

As for the Multipliers, conceiving that the Multiplier of the first Term M''' is 1, all the Multipliers will be 1, 5, 10, 10, 5, which are all, except the last, the Co-efficients of the Binomial $1+1$, raised to its fifth Power, that is, to a Power equalling the Number of all the Lives.

N. B.

N. B. THE Exception here given, does not fall upon the Number 5, but upon the last Term of the fifth Power, $1+5+10+10+5+1$, which last 1, is rejected.

OF SUCCESSIVE LIVES.

PROBLEM XI.

If A enjoys an Annuity for his Life, and at his Decease has the Nomination of a Successor B, who is also to enjoy the Annuity for his Life, to find the present Value of the two successive Lives.

SOLUTION.

LET the Values of the Lives be M and P ; let d be the Interest of 1 l . then the Value of the two successive Lives will be $M+P-dMP$.

BUT if the Successor B was himself to have the Nomination of a Life Q ; then the Value of the three successive Lives would be $M+P+Q-d \times MP+M \underbrace{Q+P \underbrace{Q+dd \times MP \underbrace{Q}}_F}$ BUT

34 Of ANNUITIES

BUT before I proceed, it is proper to observe that the Expressions MP , $M\mathcal{Q}$, $P\mathcal{Q}$ and $MP\mathcal{Q}$, signify barely Products, which is conformable to the usual Algebraic Notation ; this I take notice of, for fear those Expressions should be confounded with others that I have made use of before, *viz.* \overline{MP} , $\overline{M\mathcal{Q}}$, $\overline{P\mathcal{Q}}$ and $\overline{MP\mathcal{Q}}$, which denoted joint Lives.

BUT to comprise under one general Rule all the possible Cases that may happen about any Number of successive Lives, it will be proper to express it in Words at length, thus ;

From the Sum of all the Lives, subtract the Sum of the Products of all the Lives combined two and two, which Sum of Products before they are subtracted, ought to be multiplied by the Interest of 1 l.

To this add the Sum of the Products of all the Lives taken three and three, but multiplied again by the Square of the Interest of 1 l.

From

From this subtract the Sum of the Products of all the Lives taken four and four, but multiplied again by the Cube of the Interest of 1 l. and so on by alternate Additions and Subtractions, still observing that if there was occasion to take the Lives five and five, six and six, &c. the Interest of 1 l. ought to be raised to the 4th Power, and to the 5th, and so on.

BUT all those Operations would be very much contracted, if the Lives to be nominated were always of the same Age; for Instance 30, for suppose M to be the Value of an Annuity on an Age of 30, and d to be the Interest of 1 l. then the present Value of all the successive Lives, of which the Number is n , would be $\frac{1 - (1-d)M^n}{d}$. In

Words thus;

Multiply the Value of one Life by the Interest of 1 l. let the Product be subtracted from Unity, and let the Remainder be raised to that Power which answers to the Number of Lives; then

36 Of ANNUITIES

this Power being again subtracted from Unity, let the Remainder be divided by the Interest of 1 l. and the Quotient will be the present Value of all the successive equal Lives.

And again, if the Number of those Lives were infinite, the Sum would barely be $\frac{1}{a}$.

PROBLEM XII.

Of a Perpetual Advowson.

1°. I suppose that at the Time of the Demise of the Incumbent, the Patron would receive the Sum f , for alienating his Right of the next Presentation, if the Law did not forbid the Alienation in that Circumstance of Time.

2°. I suppose that when this Right is transfer'd, the Age of the Incumbent is such, that an Annuity upon his Life would be worth M Years Purchase, when the Interest of 1 l. is d .

THIS

THIS being supposed, the Right of the next Presentation is worth $\frac{1-dM}{dM} \times f$, and the Right of Patronage or perpetual Recurrency of the like Circumstances to Eternity would be worth $\frac{1-dM}{dM} \times f$. In Words thus;

Take the present Value of the Life of the Incumbent, and multiply it by the Interest of 1 l. and reserve the Product.

Subtract this Product from Unity, and let the Remainder be multiplied by the Sum expected f , and the new Product will shew the Right of the next Presentation; let also this be reserved.

Then divide the second Quantity reserved by the first, and the Quotient will shew the present Value of the Right of Patronage, or perpetual Recurrency.

THUS, supposing the Life of the Incumbent worth 8 Years Purchase, the Rate of Interest 5 per Cent. and the Sum f to be 100 l. the Right of the next Presentation would be worth

60 l.

38 Of ANNUITIES

60 *l.* and the Right of perpetual Recurrency 150 *l.*

PROBLEM XIII.

Of a Copy-hold.

Supposing that every Copy-hold Tenant pay to the Lord of the Manor a certain Fine on Admittance, and that every Successor does the like; to find the Value of the Copy-hold computed from the Time of a Fine being paid, independently from the Fine that may be given on Alienation.

SOLUTION.

I suppose that the Value of the Life of the present Tenant, and the Life of every future Successor when he comes to Possession is the same; this being admitted, let M be the Value of a Life, d the Interest of 1 *l.* and f the Fine to be paid, then the present Value of the Copy-hold will be $\frac{1-dM}{dM} \times f$, and this Expression being exactly the same

same as that whereby the Right of Patronage has been determined, needs no Explanation in Words.

O N L Y it is necessary to observe, that the Sum f paid in Hand being added to this, will make the Canon shorter, and will be reduced to $\frac{s}{dM}$, which may be expressed thus in Words.

Divide the Fine by the Product of the Life, multiplied by the Interest of 1 l.

T H U S, if the Life of a Tenant is worth 12 Years Purchase, and the Fine to be paid on Admittance 56 l. and also the Rate of Interest 5 per Cent. then the present Value of the Copyhold is $93\frac{1}{3}l.$

P R O B L E M XIV.

A borrows a certain Sum of Money, and gives Security that it shall be repaid at his Decease with the Interests, to fix the Sum which is then to be paid.

S O L U -

40 Of ANNUITIES

SOLUTION.

LET the Sum borrowed be f , the Life of the Borrower M Years purchase, d the Interest of 1 l . then the Sum to be paid at A 's Decease will be $\frac{f}{1-dM}$; thus, supposing $f = 800$, $M = 11.83$, $d = 0.05$, then $\frac{f}{1-dM}$ would be found $= 1958 l$; in the same manner, if the Sum to be paid at A 's Decease, was to be an Equivalent for his Life, unpaid at the Time of the Purchase, that Sum would be $\frac{M}{1-dM} = 2946 l$. Supposing the Annuity received to be 100 l . as also the Life of A 11.83 Years Purchase.

PROBLEM XV.

A borrows a Sum 1, payable at his Decease, but with this Condition, that if he dies before B, then the whole Sum is to be lost to the Lender; to find what A ought to pay at his Decease in case he survives B.

SOLU-

SOLUTION.

LET us suppose, as before, that *A* is 40 Years of Age, that the Sum borrowed is 800 *l.* and that Interest of Money is 5 *per Cent.* Farther, let it be supposed that *B* is 70 Years of Age, then, 1^o. determine what *A* should pay at his Decease, if the Life of *B* was not concerned ; by the Solution of the preceding Problem, we find the Sum to be 2316 *l.* But we ought to consider that the Lender having a Chance to lose his Money, there ought to be a Compensation for the Risque he runs, which is founded on the possibility of a Man of seventy outliving a Man of forty. Now, by the Rules to be delivered in the next Problem, we shall find that the Probability of that Contingency is measured by the Fraction $\frac{4}{23}$, and therefore the Probability of the youngest Life's surviving the oldest is $\frac{19}{23}$. Now this being the Measure of the Probability

G

42 Of ANNUITIES

bility which the Lender has of being repaid, the Sum 2316 ought to be increased in the proportion of 23 to 19, which will make it to be 2804 *l.* nearly.

Of the Probabilities of Survivorship.

PROBLEM XVI.

Any Number of Lives being given, to find their Probability of Survivorship.

SOLUTION.

LET *A, B, C, D, &c.* be the Lives, whereof *A* is supposed to be the youngest, *B* the next to it, *C* the next, &c. and so the last the oldest.

LET *n, p, q, s, t, &c.* be the respective Intervals intercepted between the Ages of those Lives, and the Extremity of old Age supposed at 86; then the Probabilities of any one of those Lives surviving all the rest, will be

for

for A	1	-	$\frac{p}{2n}$	-	$\frac{qq}{6np}$	-	$\frac{s^3}{12npq}$	-	$\frac{t^4}{20npqs}$
B	+	$\frac{p}{2n}$	-	$\frac{qq}{6np}$	-	$\frac{s^3}{12npq}$	-	$\frac{t^4}{20npqs}$	
C		+	$\frac{qq}{3np}$	-	$\frac{s^3}{12npq}$	-	$\frac{t^4}{20npqs}$		
D				+	$\frac{s^3}{4npq}$	-	$\frac{t^4}{20npqs}$		
E							+	$\frac{t^4}{5npqs}$	
&c.									

Here some few things may be observed.

1°. THAT the Probability of the youngest Life surviving all the rest, always begins with Unity, and that it is expressed by so many Terms as there are Lives concerned.

2°. THAT the Probabilities of the other Lives surviving all the rest, are always expressed each by one Term less than the preceding.

3°. THAT each first Term of those whereby each Probability is expressed, is always the Sum of all the other Terms standing above it.

44 Of ANNUITIES

4°. THAT the Numbers 2, 6, 12, 20, 30, &c. made use of in the Denominators of the Fractions are generated by the Multiplication of the following Number, 1×2 , 2×3 , 3×4 , 4×5 , &c. It would take up too much room to explain this general Rule in Words at length, for which Reason I shall content my self with explaining only the Cases of two and three Lives, which are the most necessary.

And, First, if there be two Lives of a given Age, such as 40 and 70, take their Complements of Life, which as I have explained before, are the Differences between 86 and the respective Ages, those Complements therefore are 46 and 16.

Divide the shortest Complement by the Double of the Longest, and the Quotient will express the Probability of the oldest Life surviving the youngest.

THUS in the present Case, the shortest Complement being 16, and the
the

the double of the longest being 92, I divide 16 by 92, and the Quotient $\frac{16}{92}$ or $\frac{4}{23}$ will express the Probability required.

SUBTRACT this Fraction from Unity, and the Remainder $\frac{19}{23}$ will express the Probability of the youngest Life surviving the oldest.

So that the Odds of the youngest Life surviving the oldest, are 19 to 4.

THE Case of three Lives is thus, Suppose there are three Lives of a given Age, such as 40, 45, and 60; take their respective Complements of Life, which are 46, 41, 26, then divide the Square of the shortest Complement by 3 times the Product of the other two, and the Quotient will express the Probability of the oldest Life surviving the other two.

DIVIDE the middlemost Complement by the Double of the greatest, and from the Quotient subtract the Square of the least by 6 Times the Product of the other two, and the Remainder will express the Probability of the

46 Of ANNUITIES

the middlemost Life surviving the other two.

SUBTRACT the Sum of the two foregoing Probabilities from Unity, and the Remainder will express the Probability of the youngest Life surviving the other two.

THUS in the Case proposed, the Probability of the oldest Life surviving the other two, will be found $\frac{676}{5658} = \frac{3}{25}$ nearly.

THE Probability of the middlemost Life surviving the other two will be $\frac{4367}{11316} = \frac{5}{13}$ nearly.

The Probability of the youngest Life surviving the other two will be $\frac{3}{5}$ nearly.

PROBLEM XVIII.

Any Number of Lives being given, to find the Probability of the Order of their Survivorship.

SOLUTION.

SUPPOSE the three Lives to be those of *A, B, C*, and that it be required to assign

assign the Probability of Survivorship as limited to the Order in which they are written, so that *A* shall both survive *B* and *C*, and *B* also survive *C*. This being supposed, let *n*, *p*, *q* represent the respective Complements of Life, of the youngest, middlemost, and oldest, then the Probabilities of the six different Orders that there are in three things, will be as follows ;

<i>A, B, C</i>	1	$-\frac{p}{2n}$	$-\frac{q}{2p}$	$+\frac{pq}{6np}$
<i>A, C, B</i>	-	-	$-\frac{q}{2p}$	$-\frac{pq}{3np}$
<i>B, A, C</i>		$\frac{p}{2n}$	$-\frac{q}{2n}$	$+\frac{pq}{6np}$
<i>B, C, A</i>			$\frac{q}{2n}$	$-\frac{pq}{3np}$
<i>C, A, B</i>				$\frac{pq}{6np}$
<i>C, B, A</i>				$\frac{pq}{6np}$

In Words thus ;

1°. *Divide the middlemost Complement by the double of the greatest, and let the Quotient be subtracted from Unity.*

48 Of ANNUITIES

2°. From that Remainder subtract again the Quotient of the shortest Complement divided by the Double of the Middlemost.

3°. To that new Remainder add the Quotient arising from the Square of the shortest Complement divided by six times the Product of the greatest and middlemost multiplied together, and this last Sum will express the Probability of the first Order.

THE Probability of the Second will be found thus ;

1°. Divide the shortest Complement by the double of the middlemost, and reserve the Quotient.

2°. Divide the Square of the shortest by three times the Product of the longest Complement, multiplied by the Middlemost, and reserve the new Quotient.

3°. Let the second Quotient be subtracted from the first, and the Remainder will express the Probability of the happening of the second Order.

The

THE Probability of the third Order will be found as follows.

1°. Divide the middlemost Complement by the Double of the Greatest, and reserve the Quotient.

2°. Divide the shortest Complement by the double of the longest, and reserve the Quotient.

3°. Divide the Square of the shortest Complement by six times the Product of the longest and middlemost multiplied together, and reserve the Quotient.

4°. From the first Quotient reserved, subtract the second; then to the Remainder add the Third, and the Result of these Operations will express the Probability of the third Order.

THE Probability of the fourth Order will be found thus.

1°. Divide the shortest Complement by the double of the longest, and reserve the Quotient.

2°. Divide the Square of the shortest Complement by three Times the Product of the longest and middlemost, and reserve the new Quotient.

50 Of ANNUITIES

3°. From the first Quotient reserved, subtract the second, and the Remainder will express the Probability of the fourth Order.

THE fifth Order will be found as follows.

Divide the Square of the shortest Complement by six times the Product of the longest and middlemost, multiplied together, and the Quotient will express the Probability required.

THE Probability of the last Order is the same as that of the fifth.

PROBLEM XVII.

D, whilst in Health, makes a Will, whereby he bequeaths 500 l. to E, and 300 l. to F. with this Condition, that if either of them dies before him, the whole is to go to the Survivor of the two; what are the Values of the Expectations of E and F, estimated from the time that the Will was writ.

SOLU-

SOLUTION.

SUPPOSE D to be 70 Years of Age, E 36, and F 45; suppose also that d represents the Interest of 1 $l.$ when Interest is at 5 per Cent.

AN Annuity upon the Life of D is worth 5.77, as appears from our Tables, which Value we may call M .

WHEREFORE if it was sure that D would die before either of them, the Expectation of E upon that Account, would be worth in present Value $\frac{1-d}{1-d} M \times 500$, and the Expectation of F , $\frac{1-d}{1-d} M \times 300$; which being reduced to Numbers, are respectively 355 $l.$ 15 $s.$ and 213 $l.$ 9 $s.$

BUT as this depends on the Probability of D 's dying first, we are to look for that Probability, which is composed of two Parts, that is, when the Order of Survivorship is either E, F, D , or F, E, D ; now the Order E, F, D , is the same as A, B, C , in the preceding Problem, whereof the Probability is $1 - \frac{p}{2n} - \frac{q}{2p} + \frac{qq}{6np}$, and the Or-

50 Of ANNUITIES

3°. From the first Quotient reserved, subtract the second, and the Remainder will express the Probability of the fourth Order.

THE fifth Order will be found as follows.

Divide the Square of the shortest Complement by six times the Product of the longest and middlemost, multiplied together, and the Quotient will express the Probability required.

THE Probability of the last Order is the same as that of the fifth.

PROBLEM XVII.

D, whilst in Health, makes a Will, whereby he bequeaths 500 l. to E, and 300 l. to F. with this Condition, that if either of them dies before him, the whole is to go to the Survivor of the two; what are the Values of the Expectations of E and F, estimated from the time that the Will was writ.

SOLU-

SOLUTION.

SUPPOSE D to be 70 Years of Age, E 36, and F 45; suppose also that d represents the Interest of 1 l . when Interest is at 5 per Cent.

AN Annuity upon the Life of D is worth 5.77, as appears from our Tables, which Value we may call M .

WHEREFORE if it was sure that D would die before either of them, the Expectation of E upon that Account, would be worth in present Value $\frac{1-d}{1} M \times 500$, and the Expectation of F , $\frac{1-d}{1} M \times 300$; which being reduced to Numbers, are respectively 355 l . 15 s . and 213 l . 9 s .

BUT as this depends on the Probability of D 's dying first, we are to look for that Probability, which is composed of two Parts, that is, when the Order of Survivorship is either E, F, D , or F, E, D ; now the Order E, F, D , is the same as A, B, C , in the preceding Problem, whereof the Probability is $1 - \frac{p}{2n} - \frac{q}{2p} + \frac{qq}{6np}$, and the Order

H 2

der

54 Of ANNUITIES

Age may justly expect to continue in being.

I have found by a Calculation deduced from the Method of Fluxions, that upon Supposition of an equable Decrement of Life, the Expectation of Life would be expressed by $\frac{1}{2}n$, supposing n to denote its Complement.

HOWEVER, if that Interval be once attained, there arises a new Expectation of $\frac{1}{4}n$, and afterwards of $\frac{1}{8}n$, and so on. This being laid down, I shall proceed farther.

PROBLEM XVIII.

To find the Expectation of two joint Lives, that is, the Time which two Lives may expect to continue together in being.

SOLUTION.

LET the Complements of the Lives be n and p , whereof n be the longest and

and p the shortest, then the Expectation of the two joint Lives will be $\frac{1}{2}p - \frac{pp}{6n}$, in Words thus.

From $\frac{1}{2}$ the shortest Complement, subtract the 6th Part of his Square, divided by the greatest, the Remainder will express the Number of Years sought.

THUS, supposing a Life of 40, and another of 50, the shortest Complement will be 36, the greatest 46, $\frac{1}{2}$ of the shortest will be 18, the Square of 36 is 1296, whereof the sixth Part is 216, which being divided by 46, the Quotient will be $\frac{216}{46} = 4.69$ nearly; and this being subtracted from 18, the Remainder 13.31 will express the Number of Years due to the two joint Lives.

COROLLARY.

IF the two Lives be equal, the Expectation of the two joint Lives will be

56 Of ANNUITIES

be $\frac{1}{3}$ part of their common Complement.

PROBLEM XIX.

Any Number of Lives being given, whether equal or unequal, to find how many Years they may be expected to continue together.

SOLUTION.

1^o. TAKE $\frac{1}{2}$ of the shortest Complement.

2^o. TAKE $\frac{1}{6}$ part of the Square of the shortest, which divide successively by all the other Complements, then add all the Quotients together.

3^o. TAKE $\frac{1}{12}$ part of the Cube of the shortest Complement, which divide successively by the Product of all the other Complements, taken two and two.

4^o. THEN take $\frac{1}{20}$ part of the Biquadrate of the shortest Complement,
which

which divide successively by the Products of all the other Complements, taken three and three, and so on.

5°. THEN from the Result of the first Operation, subtract the Result of the second, to the Remainder add the Result of the third, from the Sum subtract the Result of the fourth, and so on.

6°. THE last Quantity remaining after these alternate Subtractions and Additions, will be the thing required.

N. B. The Divisors 2, 6, 12, 20, &c. are the Products of 1 by 2, of 2 by 3, of 3 by 4, of 4 by 5, &c.

COROLLARY.

IF all the Lives be equal, add Unity to the Number of Lives, and divide their common Complement by that Number thus increased by Unity, and the Quotient will always express the Time due to their joint Continuance.

58 Of ANNUITIES

PROBLEM XX.

Two Lives being given, to find the Number of Years due to the longest.

SOLUTION.

FROM the Sum of the Years due to each Life, subtract the Number of Years due to their joint Continuance, the Remainder will be the Number of Years due to the Longest, or Survivor of them both.

THUS, supposing a Life of 40, and another of 50, the Number of Years due to the Life of 40, is 23; the Number of Years due to the Life of 50, is 18; from the Sum of 23 and 18, *viz.* 41, subtract 13.31 due to their joint Continuance, the Remainder 27.69 will be the Time due to the longest.

COROLLARY.

IF the Lives be equal then $\frac{2}{3}$ of their common Complement will be the Number
ber

ber of Years due to the Survivor.

THUS, supposing two Lives of 50, then their Complement will be 36; whereof two thirds will be 24; which is the Time due to the Survivor of the two.

PROBLEM XXI.

Any Number of Lives being given, to find the Number of Years due to the Longest.

SOLUTION.

LET the Years due to each Life be respectively denoted by M , P , Q , S , &c. then let the joint Lives taken, two and two be denoted by \overline{MP} , \overline{MQ} , \overline{MS} , \overline{PQ} , &c. let also the joint Lives, taken three and three, be denoted by \overline{MPQ} , \overline{MPS} , \overline{MQS} , \overline{PQS} , &c. Moreover, let the joint Lives taken four and four, be denoted by \overline{MPQS} , &c. then if there be three Lives, the Time due to the longest will be

60 *Of ANNUITIES*

$$\begin{aligned}
 & M - \overline{MP} + \overline{MPQ} \\
 & + P - \overline{MQ} \\
 & + Q - \overline{PQ}
 \end{aligned}$$

BUT if all the Lives be equal, let n be their common Complement, then the Time due to the longest, will be $\frac{3}{4}n$.

IF there be four Lives, the Time due to the longest will be

$$\begin{aligned}
 & M - \overline{MP} + \overline{MPQ} - \overline{MPQS} \\

 \end{aligned}$$

BUT if all the Lives be equal, the Time due to the longest will be expressed by $\frac{4}{5}$ of their common Complement.

Universally, if the Common Complement of equal Lives be n , and the Number of Lives p , the Number of
Years

Years due to the Longest of them will be $\frac{p}{p+1} \times n$.

PROBLEM XXII.

Any Number of equal Lives being given, to find the Time in which one, or two, or three, &c. of them will fail.

SOLUTION.

LET n be their common Complement, p the Number of all the Lives, q the Number of those which are to fail, then $\frac{q}{p+1} \times n$ will express the Time required. In Words thus;

Multiply the common Complement of the Lives by the Number of the Lives that are to drop, and divide the Product by the Number of all the Lives increased by Unity.

THUS, supposing 100 Lives, each of 40 Years of Age, it will be found that 5 of them will drop in about two Years and a Quarter..

BUT

62 Of ANNUITIES

BUT if we put t for the Time given we shall have the four following Equations ;

$$1^{\circ}. t = \frac{q^n}{p+1}$$

$$2^{\circ}. q = \frac{p+1 \times t}{n}$$

$$3^{\circ}. p = \frac{nq - t}{t}$$

$$4^{\circ}. n = \frac{p+1 \times t}{q}$$

In which any three of the four Quantities n , p , q , t , being given, the fourth will be known.

THIS Speculation might be carried to any Number of unequal Lives, but my Design not being to perplex the Reader with too great Difficulties, I shall forbear at present to prosecute the thing any farther.

PRO-

PROBLEM XXIII.

A who is 30 Years of Age, buys an Annuity for a limited Time of his Life, suppose 10 Years, on Condition that if he dies before the Expiration of that Time, the Purchase-Money is wholly to be lost to his Heirs; to find the present Value of the Purchase, supposing Interest at 5 per Cent.

SOLUTION.

LET M be the Value of an Annuity for a Life of 30, P the Value of an Annuity for a Life of 40, which exceeds the Life given by the limited time of ten Years; let Q be the Value of an Annuity certain for 10 Years, n the Complement of Life at the beginning of the limited time of 10 Years, and p the Complement of Life at the End of that Time; then the present

64 Of ANNUITIES

present Value of the Purchase will be $M - \frac{P \times I}{d} \times \frac{1 - d^Q}{d}$; d being the Interest of 1 l . In words thus :

1°. Take from the Tables the Value of an Annuity certain for the limited Time given at the given Rate.

2°. Multiply this Value by the Interest of 1 l . and subtract the Product from Unity, and reserve the Remainder.

3°. Multiply the Value of an Annuity for an Age, exceeding the Age given by the limited Time 10, which in this Case is an Annuity for a Life of 40, by the Complement of Life at that Time, in this Case: 46; and divide the Product by the Complement of Life at the beginning of the limited Time here, 56; reserving the Quotient.

4°. Multiply the two Numbers reserved together, and subtract the Product from the Value of an Annuity for the given Age, here: 30; and the Remainder will be the Value of the Thing required.

IT

It is evident by the foregoing Process, that altho' the Question there proposed is particular, yet the Solution is general, which Method often practised in my *Doctrine of Chances*, is of singular Use to fix the Reader's Imagination.

PROBLEM XXIV.

A pays an Annuity of 100 l. during the Lives of *B* and *C*, each 34 Years of Age; to find what *A* ought to give in present Money to buy off the Life of *B*, supposing Interest at 4 per Cent.

SOLUTION.

It will be found by our Tables that an Annuity upon a Life of 34 is worth 14.12 Years Purchase, and by the Rules before delivered, that an Annuity upon the longest of the two Lives of *B* and *C* is worth 18.40; hence it is very plain, that to buy off the Life of *B*, *A* must pay the Difference between 18.40 and 14.12, which being 4.28, it follows that *A* ought to pay 428 l.

66 Of ANNUITIES

IN the same manner, if *A* were to pay an Annuity during the three Lives of *B*, *C*, *D*, whether of the same or different Ages, it would be easy to determine what *A* ought to pay to buy off one of the Lives of *B*, *C*, *D*, or any two of them, or to redeem the whole.

FOR, 1°. if the Life of *D* is to be bought off, then from the Value of the three Lives subtract the Value of the two Lives of *B* and *C*, and the Remainder is what is to be given to buy off the Life of *D*.

2°. IF the two Lives of *C* and *D* were to be bought off; then from the Value of the three Lives, subtract the Life of *B*, and the Remainder is what is to be given to buy off those two Lives.

Lastly, It is plain that to redeem the whole, the Value of the three Lives ought to be paid.

PROBLEM XXV.

A whose Life is worth 14 Years Purchase, supposing Interest at 4 per Cent.

is to enjoy an Annuity of 100 l. during the Term of 31 Years; B has the Reversion of it after the Decease of A for the Term remaining; to find the Value of B's Expectation.

SOLUTION.

SINCE the Life of *A* is supposed to be worth 14 Years Purchase when Interest is at 4 per Cent. it follows from the Tables that *A* must be about 35 Years of Age, therefore find by the twenty-third Proposition the Value of an Annuity on a Life of 35, to continue the limited Time of 31 Years; let that Value be subtracted from the Value of an Annuity certain, to continue 31 Years; and the Remainder will be the Value of the Reversion.

PROBLEM XXVI.

A is to have an Annuity of 100 l. for him and his Heirs after the failing of any one of the Lives M, P, Q, the first of which is worth 13 Years Purchase, the second 14, and the third 15; to find the present Value of his Expectation,

68 Of ANNUITIES

tion, Interest of Money being supposed at 4 per Cent.

SOLUTION.

By the Example to Prob. 3. it appears, that an Annuity upon the above 3 joint Lives is worth 7.41 Years Purchase ; let this be supposed = R , and let f represent the present Value of a Perpetuity of 100 l . which in this Case is 2500 l . then the present Expectation of A will be worth $\frac{R}{1-i} \times f$. In Words thus ;

Multiply the Value of the three joint Lives by the Interest of 1 l . then subtracting that Product from Unity, let the Remainder be multiplied by the Value of the Perpetuity, and the Product will be the Expectation required.

IN this Case 7.41, multiplied by 0.04, produces 0.2964, and this Product subtracted from Unity, leaves 0.7036 ; now this Remainder being multiplied by 2500, produces 1759 l . the Expectation of A .

BUT if the Problem had been, that A should not have the Annuity before the

the Failing of any two of those Lives, then from the Sum of all the joint Lives combined two and two, subtract the double Value of the three joint Lives, and let the Remainder be called T , then the Expectation of A will be worth $\overline{1-dT} \times f$; now, by the Rules before delivered, we shall find that the Sum of all the joint Lives combined two and two, is 29.06, from which subtracting the double of the three joint Lives, *viz.*, 14.82, the Remainder is 14.24. Hence supposing $T = 14.24$, then $\overline{1-dT} \times f$ will be found to be 1076 *l.* and this is the Value of A 's Expectation.

Lastly, If A was not to have the Annuity before the Extinction of the three Lives, suppose the Value of the three Lives $= V$, then the Expectation of A would be worth $\overline{1-dV} \times f$, which in this Case is 465 *l.* •

70 Of ANNUITIES

PROBLEM XXVII.

To determine the Fines to be paid for renewing any Number of Years in a College-Lease of twenty, and also what Rate of Interest is made by a Purchaser, who may happen to give an advanced Price for the same, upon Supposition that the Contractor is allowed 8 per Cent. of his Money.

ALTHO' the Problem here proposed does not seem to relate to the Subject of this Book, yet as some useful Conclusions may be derived from the Solution of it, I have thought fit to insert it in this place.

Table of Fines.

1	0.2146	8	2.2821	15	5.8254
2	0.4463	9	2.6792	16	6.5060
3	0.6965	10	3.1081	17	7.2411
4	0.9666	11	3.5713	18	8.0349
5	1.2587	12	4.0715	19	8.9922
6	1.4133	13	4.6118	20	9.8181
7	1.9144	14	5.1953		

If

IF a Purchaser gives the Original Contractor 11 Years Purchase for his Lease of 20, he makes above $6\frac{1}{2}$ per Cent. of his Money.

IF he gives 12 Years Purchase for the same, he makes above 5 l. 8 s. per Cent. of his Money.

IF he gives 13 Years Purchase, he makes $4\frac{1}{2}$ per Cent. of his Money.

PROBLEM XXVIII.

To determine the Fines to be paid for renewing any Number of Years in a College-Lease of One and Twenty, as also what Rate of Interest is made by a Purchaser who may happen to give an advanced Price for the same, upon Supposition that the Contractor is allowed 8 per Cent. of his Money.

Table

72 Of ANNUITIES

Table of Fines.

1	0.1987	8	2.1131	15	5.3940
2	0.4133	9	2.2808	16	6.0241
3	0.6450	10	2.8779	17	6.7047
4	0.8952	11	3.3068	18	7.4398
5	1.1653	12	3.7700	19	8.2336
6	1.4574	13	4.2702	20	9.0909
7	1.6120	14	4.8105	21	10.0168

HE that gives 11 Years Purchase, instead of 10.0168 for renewing his Lease for 21 Years, makes 6 *l.* 15 *s.* *per Cent.* of his Money.

HE who gives 12 Years Purchase for the same, makes very near 5 *l.* 16 *s.* *per Cent.* of his Money.

HE who gives 13 Year Purchase for the same, makes a little more than 4 *l.* 16 *s.* *per Cent.* of his Money.

PRO-

74 Of ANNUITIES

Interest is 4, 5, or 6 *per Cent.* and the Remainder will be the Value of the Half-Yearly Payments required; thus, if the Annuity was 100 *l.* the Half-Yearly Payments would respectively be 49 *l.* 10 *s.* 49 *l.* 7 *s.* 6 *d.* 49 *l.* 5 *s.* 3 *d.* nearly.

PROBLEM XXX.

The present Value of an Annuity being given, to find how much this present Value ought to be increased, when it is required that the Payments shall be Half-Yearly, and also one half of the Yearly Payments, when Interest is at 4, 5, or 6 per Cent.

SOLUTION.

To the present Value of the Annuity, add respectively its 99th, 79th, or 67th, and the Sums will be the Values increased.

As there are some Persons who may be desirous to see a general Solution of
the

the two last Problems, I have thought fit to add what follows.

IN the first of the two last Problems, let A be the Yearly Payments agreed on, and B the Half-Yearly Payments required, r the Yearly Rate of Interest, then $B = \frac{r^{\frac{1}{2}} - 1}{r - 1} \times A$. In the second, let M be the present Value of the Yearly Payments, P the present Value of those that are to be Half-Yearly, then $P = \frac{\frac{1}{2} \times r - 1}{r^{\frac{1}{2}} - 1} \times M$.

M

APPEN-

APPENDIX:

Containing the Demonstrations of some of the principal Propositions in the foregoing Treatise.

CHAPTER I.

I Observed formerly, that upon Supposition that the Decrements of Life were in Arithmetic Progression, the Conclusions derived from thence, would very little vary, from those that could be deduced from the Table of Observations made at *Bresslaw*, concerning the Mortality of Mankind; which Table was about fifty Years ago inserted by Dr. *Halley* in the *Philosophical Transactions*, together with some Calculations concerning the Values of Lives according to a given Age.

UPON the foregoing Principle, I supposed that if n represented the Com-

M 2

plement

84 A P P E N D I X.

plement of Life, the Probabilities of living 1, 2, 3, 4, 5, &c. Years, would be expressed by the following Series, $\frac{n-1}{n}$, $\frac{n-2}{n}$, $\frac{n-3}{n}$, $\frac{n-4}{n}$, $\frac{n-5}{n}$, &c. and consequently that the Value of a Life, whose complement is n , would be expressed by the Series

$\frac{n-1}{nr} + \frac{n-2}{nrr} + \frac{n-3}{nr^2} + \frac{n-4}{nr^3} + \frac{n-5}{nr^4}$, &c. the Sum of which I have asserted in my

third Page to be $\frac{1-\frac{r}{n}P}{r-1}$, where the Signification of the Quantities P and r is explained.

As the Reasonings that led me to that general Expression, require something more than an ordinary Skill in the Doctrine of Series, I shall forbear to mention them in this Place, and content my self with pointing out to the Reader a Method, whereby he may satisfy himself of the Truth of that Theorem, provided he understand so much of a Series, as to be able to sum up a Geometric Progression.

D E-

DEMONSTRATION.

$$P = \frac{1}{r} + \frac{1}{rr} + \frac{1}{r^2} + \frac{1}{r^3} + \frac{1}{r^4} \dots + \frac{1}{r^n}$$

Therefore,

$$rP = 1 + \frac{1}{r} + \frac{1}{rr} + \frac{1}{r^2} + \frac{1}{r^3} \dots + \frac{1}{r^{n-1}}$$

And

$$\frac{rP}{n} = \frac{1}{n} + \frac{1}{nr} + \frac{1}{nrr} + \frac{1}{nr^2} + \frac{1}{nr^3} \dots + \frac{1}{nr^{n-1}}$$

Therefore,

$$1 - \frac{rP}{n} = \frac{n-1}{n} - \frac{1}{nr} - \frac{1}{nrr} - \frac{1}{nr^2} - \frac{1}{nr^3} \dots - \frac{1}{nr^{n-1}}$$

But this is to be divided by $r-1$, or multiplied by

$$\frac{1}{r-1} = \frac{1}{r} + \frac{1}{rr} + \frac{1}{r^2} + \frac{1}{r^3} + \frac{1}{r^4} + \frac{1}{r^5} \dots \text{c.}$$

Then multiplying actually those two Series together, the Product will be found to be

$$\begin{aligned} & \frac{n-1}{nr} - \frac{1}{nrr} - \frac{1}{nr^2} - \frac{1}{nr^3} - \frac{1}{nr^4} - \frac{1}{nr^5} - \frac{1}{nr^6} \text{c.} \\ & + \frac{n-1}{nrr} - \frac{1}{nr^2} - \frac{1}{nr^3} - \frac{1}{nr^4} - \frac{1}{nr^5} - \frac{1}{nr^6} \text{c.} \\ & + \frac{n-1}{nr^2} - \frac{1}{nr^3} - \frac{1}{nr^4} - \frac{1}{nr^5} - \frac{1}{nr^6} \text{c.} \\ & + \frac{n-1}{nr^3} - \frac{1}{nr^4} - \frac{1}{nr^5} - \frac{1}{nr^6} \text{c.} \\ & + \frac{n-1}{nr^4} - \frac{1}{nr^5} - \frac{1}{nr^6} \text{c.} \\ & + \frac{n-1}{nr^5} - \frac{1}{nr^6} \text{c.} \\ & + \frac{n-1}{nr^6} \text{c.} \end{aligned}$$

And

And adding the Terms of the perpendicular Columns together, we shall have

$$\frac{n-1}{nr} + \frac{n-2}{nr^2} + \frac{n-3}{nr^3} + \frac{n-4}{nr^4} + \frac{n-5}{nr^5} + \frac{n-6}{nr^6} \text{ \&c.}$$

which consequently is equal to $\frac{1 - \frac{r}{n} P}{r-1}$,

which was to be demonstrated.

IF it be required that upon the Failing of a Life, such Part of the Annuity should be paid, as may be proportional to the time elapsed from the beginning of the last Year, to the time of the Life's failing, then the Value of the Life will be $\frac{1}{r-1} - \frac{1}{an} P$, wherein a represents the hyperbolic Logarithm of the Rate of Interest.

BUT because there are no Tables printed of hyperbolic Logarithms, and that the Reduction of a common Logarithm to an hyperbolic is somewhat laborious, it will be sufficient here to set down the hyperbolic Logarithms of 1.04, 1.05, 1.06, which are respectively, 0.03922, 0.04879, 0.05825, or $\frac{2}{51}$, $\frac{2}{41}$, $\frac{6}{103}$ nearly.

CHAPTER II.

Explaining the Rules of combined Lives.

SUPPOSING a fictitious Life, whose Number of Chances to continue in being, from Year to Year, be constantly equal to a , and the Number of Chances for failing be constantly equal to b , so that the odds of its continuing during the Space of any one Year, be to its failing in the same interval of Time constantly as a to b , the Value of an Annuity upon such Life would be easily found.

FOR, if we make $a + b = s$, the Probabilities of living 1, 2, 3, 4, 5, &c. Years would be represented by the Series $\frac{a}{s}, \frac{aa}{s^2}, \frac{a^3}{s^3}, \frac{a^4}{s^4}, \frac{a^5}{s^5}, \&c.$ continued to eternity, and consequently the Value of an Annuity upon such Life would be expressed by this new Series $\frac{a}{sr} + \frac{aa}{ssrr} + \frac{a^3}{s^3r^3} + \frac{a^4}{s^4r^4} \&c.$ which being a geometric Progression perpetually decreasing, the Sum of it will be found

found to be $\frac{a}{r-a}$; thus, if a stands for 21, and b for 1, and also r for 1.05, the Value of such Life would be 10 Years Purchase.

FROM these Premises the following Corollaries may be drawn :

C O R O L L A R Y I.

AN Annuity upon a fictitious Life being given, the Probability of its continuing one Year in being is also given; for let the Value be $=M$, then

$$\frac{a}{f} = \frac{Mr}{M+1}$$

C O R O L L A R Y II.

IF a Life, whose Value is deduced from our Tables, is found to be worth 10 Years purchase, then such Life is equivalent to a fictitious Life, whose Number of Chances for continuing one Year, is to the Number of Chances for its failing in that Year, as 21 to 1.

C O R O L L A R Y III.

WHEREFORE having taken the Value of a Life from our Tables, or calculated

culated it according to the Rules prescribed, we may transfer the Value of that Life to that of a fictitious Life, and find the Number of Chances it would have for continuing or failing Yearly.

COROLLARY IV.

AND the Combination of two or more *real Lives* will be very near the same as the Combination of so many corresponding *fictitious Lives*; and therefore an Annuity granted upon one or more real Lives, is nearly of the same Value as an Annuity upon a fictitious Life.

THESE things being premised, it will not be difficult to determine the Value of an Annuity upon two or three, or as many joint Lives as may be assigned.

FOR let x represent the Probability of one Life's continuing from Year to Year, and y the Probability of another Life's continuing the same Time, then

N ac-

according to the Principles of the Doctrine of Chances, the Terms

$xy, xxyy, x^3y^3, x^4y^4, x^5y^5, \&c.$
 will respectively represent the Probabilities of continuing together, 1, 2, 3, 4, 5, &c. Years; then the Value of an Annuity upon the two joint Lives, will be $\frac{xy}{r} + \frac{xxyy}{rr} + \frac{x^3y^3}{r^3} + \frac{x^4y^4}{r^4} + \frac{x^5y^5}{r^5} \&c.$ which being a Geometrical Progression perpetually decreasing, the Sum of it will be found to be $\frac{xy}{r-xy}$; let now M be put for the Value of the first Life, and P for the Value of the second, then by our first Corollary it appears that $x = \frac{Mr}{M+1}$, and $y = \frac{Pr}{P+1}$, and therefore having written these Values of x and y in the Expression $\frac{xy}{r-xy}$, which is the Value of the two joint Lives, it will be changed into $\frac{MPr}{M+1 \times P+1 - MPr}$, which is the same Theorem that I had given in my first Edition, which came out seventeen Years ago.

IT is true that in the sixth Page of this Book I have given a Theorem which seems very different from this, making the Value of the joint Lives to be $\frac{MP}{M+P-dMP}$, wherein d represents the Interest of 1 $l.$ and yet I may assure the Reader, that this last Expression is originally derived from the first, and that whether one or the other is used, the Conclusions will very little differ, but the first Theorem is better adapted to Annuities paid in Money, it being customary that the last Payment, whether it be Yearly or Half-Yearly, is lost to the Purchaser; whereas the second Theorem is better fitted to Annuities paid by a Grant of Lands, whereby the Purchaser makes Interest of his Money to the last Moment of his Life, for which Reason I have chose to use the last Expression in my Book.

By following the same Method of Investigation, we shall find that if M, P, Q , denote three single Lives, an

Annuity upon those joint Lives will be

$$\frac{MP \mathcal{Q}_{rr}}{M + 1 \times P + 1 \times \mathcal{Q} + 1 - MP \mathcal{Q}_{rr}}; \text{ in the Case}$$

of Annuities payable in Money, or

$$\frac{MP \mathcal{Q}}{MP + M \mathcal{Q} + P \mathcal{Q} - 2dMP}, \text{ in the Case of}$$

Annuities paid by a Grant of Lands.

C H A P T E R I I I.

Containing the Demonstration of the Rules given in Problems 4th and 5th, for determining the longest Life.

LET x and y represent the respective Probabilities which two Lives have of continuing one Year in being, therefore $1-x$ is the Probability of the first Life's failing in one Year, and $1-y$ the Probability of the second Life's failing in one Year: Therefore multiplying these two Probabilities together, the Product $1-x-y+xy$ will represent the Probability of the two Lives failing in one Year, and if this be subtracted from Unity, the Remainder

der $x+y-xy$ will express the Probability of one at least of the two Lives outliving one Year, which is sufficient for establishing the first Year's Rent.

AND for the same Reason $xx+yy-xyy$ will express the Probability of one at least of the two Lives outliving two Years, which is sufficient to establish the second Year's Rent.

FROM the two Steps we have taken, it plainly appears that the longest of two Lives is expressible by the three following Series ;

$$\begin{aligned} & \frac{x}{r} + \frac{xx}{rr} + \frac{x^3}{r^3} + \frac{x^4}{r^4} + \frac{x^5}{r^5} \\ & + \frac{y}{r} + \frac{yy}{rr} + \frac{y^3}{r^3} + \frac{y^4}{r^4} + \frac{y^5}{r^5} \\ & - \frac{xy}{r} - \frac{xyy}{rr} - \frac{x^2y^2}{r^3} - \frac{x^3y^3}{r^4} - \frac{x^4y^4}{r^5} \end{aligned}$$

Whereof the first represents an Annuity upon the first Life, the second an Annuity upon the second Life, and the third an Annuity upon the two joint Lives ; and therefore we may conclude that an Annuity upon the longest of two Lives, is the Difference between
the

the Sum of the Values of the single Lives, and the Value of the joint Lives, which has been expressed in my 14th Page by the Symbols $M+P-\overline{MP}$.

IN the same manner it will be found that if x, y, z , represent the respective Probabilities of three Lives living one Year, then the Probability of their not failing all three in one Year will be expressed by $x+y+z-xy-xz-yz+xyz$, which is sufficient to ground this Conclusion, that an Annuity upon the longest of three Lives, is the Sum of the single Lives, *minus* the Sum of the joint Lives, *plus* the three joint Lives, which has been expressed by me, by the Symbols $M+P+Q-\overline{MP}-\overline{MQ}-\overline{PQ}+\overline{MPQ}$.

FROM the foregoing Conclusions, it is easily perceived how the Value of the longest of any Number of Lives ought to be determined, *viz.* by the Sum of the Values of the single Lives, *minus* the Sum of the Values of all the joint Lives taken two and two

two, *plus* the Sum of all the joint Lives taken three and three, *minus* the Sum of all the joint Lives taken four and four, and so on by alternate Additions and Subtractions.

CHAPTER IV.

Containing the Demonstrations of what has been said concerning Reversions, and the Value of one Life after one or more Lives.

1°. It plainly appears that the present Value of a Reversion after one Life, is the Difference between the Perpetuity, and the Value of the Life in Possession : Thus, if the Life in Possession be worth 14 Years purchase, and that I have the Reversion after that Life, and have a mind to sell it, I must have for it 11 Years purchase, which is the Difference between the Perpetuity 25, and 14 the Value of the Life, when Money is rated at 4 *per Cent.*

2°. IT

2°. IT is as evident that the Reversion after two, three, or more Lives, is the Difference between the Perpetuity, and the longest of all the Lives.

BUT the Value of a Life after one or more Lives not being so obvious, I think it is proper to insist upon it more largely; let x therefore represent the Probability of the Expectant's Life continuing one Year in being, and y the Probability of the second Life's continuing also one Year in being, and therefore $1-y$ is the Probability of that second Life's failing in that Year; from which it follows, according to the Doctrine of Chances, that the Probability of the first Life's continuing one Year, and of the second's failing in that Year, is $x \times \overline{1-y}$, or $x - xy$, which is a sufficient foundation for drawing the following Conclusion, *viz.* that the Value of the first Life after the second is the Value of that first Life *minus* the Value of the two joint Lives, which I have expressed by the Symbols $M - \overline{MP}$.

IN the same manner, if x, y, z , represent the respective Probabilities of three Lives continuing one Year, then $x \times 1 - y \times 1 - z$, will represent the Probability of the first Life's continuing one Year, and of the other two Lives failing in that Year; but the foregoing Expression is brought, by actual Multiplication, to its Equivalent $x - xy - xz + xyz$, from whence can be deduced by meer Inspection the Rule given in our 20th *pag. viz.* that the present Value of the first Life's Expectation after the Failing of the other two, is

$$M - MP - M Q + MP Q.$$

CHAPTER V.

Containing the Demonstration of what has been asserted in the Solution of the 10th and 26th Problems.

It appears from the Solution of the 10th Problem, that $M^{\#}$ denoting the present Value of an Annuity to continue so long as three Lives of the same

O

Age

98 A P P E N D I X.

Age subsist together, let us suppose that n denotes the Number of Years during which the Annuity will continue; then supposing r to express the Rate of Interest, it is well known that the present Value of that Annuity will be

$\frac{1 - \frac{1}{r^n}}{r - 1}$, wherefore we have the Equation

$$M^n = \frac{1 - \frac{1}{r^n}}{r - 1}, \text{ or making } r - 1 = d,$$

$$M^n = \frac{1 - \frac{1}{r^n}}{d}, \text{ from whence will be de-}$$

deduced $\frac{1}{r^n} = 1 - dM^n$, and consequent-

ly $r^n = \frac{1}{1 - dM^n}$. Now let us suppose that

a Sum f is to be received to eternity at the equal Intervals of Time, denoted by n , and that we want to find the present Value of it; it is plain to those who have made some Proficiency in

Algebra, that $\frac{f}{r^n - 1}$ is the present Value

of it, let us therefore in the room of r^n substitute its Value found before, *viz.*

$$\frac{1}{1 - dM^n}$$

$\frac{1}{1-dM^n}$, and then r^n-1 will be found equal to $\frac{dM^n}{1-dM^n}$, and consequently $\frac{f}{r^n-1} = \frac{1-dM^n}{dM^n} \times f$, which is the Assertion of my 23d Page.

Now it will be easy to find n , for let us suppose $\frac{1}{1-dM^n} = T$, then $r^n = T$, and therefore $n = \frac{\log. T}{\log. r}$.

THE 25th Problem has some Affinity with the 10th, in the former it was required to know the present Value of a Sum f , payable at the Failing of any one of three equal Lives, but in the latter the three Lives are supposed unequal; but besides, it is extended to two other Cases, *viz.* to the present Value of a Sum f to be paid after the Failing of any two of the Lives, as also to the present Value of a Sum f to be paid after the Failing of the three Lives.

FOR in the first Case, let us imagine an Annuity to be paid as long as the three Lives are in being; or, which is the same thing, till one of the Lives fails,

100 APPENDIX.

fails, and let us suppose that R represents the Value of the three joint Lives ; let us also suppose that n is the Number of Years after which this will happen, and that d is the Interest of $1l.$ therefore $\frac{1}{r^n}$ is the present Value of the

$1 - \frac{1}{r^n}$

Sum f to be then paid, but $R = \frac{1 - \frac{1}{r^n}}{d}$, therefore $\frac{1}{r^n} = 1 - dR$, and therefore $\frac{f}{r^n} = \overline{1 - dR \times f}$.

BUT the second Case has something more of Difficulty, and therefore I shall enlarge a little more upon it ; let us imagine now that there is an Annuity to continue not only as long as the three equal Lives are in being, but as long as any two of the said Lives are in being ; now in order to find the present Value of the said Annuity, let us suppose that x, y, z , represent the respective Probabilities of the said Lives continuing one Year. Therefore,

1^o. $x y z$ represents the Probability of their all outliving the Year.

2°. $xy \times \overline{1-z}$, or $xy - xyz$ represents the Probability of the two first outliving the Year, and of the third failing in that Year.

3°. $xz \times \overline{1-y}$ represents the Probability of the first and third's outliving the Year, and of the second's failing in that Year.

4°. $yz \times \overline{1-x}$, or $yz - xyz$ represents the Probability of the second and third's outliving the Year, and of the first's failing in that Year.

THEN adding those several Products together, their Sum will be found equal to $xy + xz + yz - 2xyz$, which is an Indication that the present Value of an Annuity to continue as long as two of the said Lives are in being is $\overline{MP} + \overline{MQ} + \overline{PQ} - 2\overline{MPQ}$, which we may suppose $= T$.

LET us now compare this with an Annuity certain to continue n Years, the Rate of Interest being supposed $= r$, and $r - 1 = d$, then we shall have

have the Equation $\frac{1 - \frac{1}{r^n}}{d} = T$, from whence we shall find $\frac{1}{r^n} = 1 - dT$, and consequently $\frac{f}{r^n}$ which is the present Value of the Expectation required, is $= \overline{1 - dT} \times f$.

By the same Method of Process, we may find the present Value of an Annuity to continue so long as any one of the three Lives in question is subsisting, for let x, y, z , represent the same things as before.

1°. $x y z$ represents the Probability of the three Lives outliving the first Year.

2°. $x y + x z + y z - 3 x y z$ represents the Probability of two of them outliving the Year, and of the third's failing in that Year.

3°. $x \times \overline{1 - y} \times \overline{1 - z}$, or $x - xy - xz + xyz$ represents the Probability of the first Life's outliving the Year, and of the other two failing in that Year.

4°.

4°. $y \times \overline{1-x} \times \overline{1-z}$, or $y - xy - zy + xyz$ represents the Probability of the second Life's outliving the Year, and of the other two failing in that Year.

5°. $z \times \overline{1-x} \times \overline{1-y}$, or $z - xz - yz + xyz$ represents the Probability of the third Life's outliving the Year, and of the other two failing in that Year.

Now the Sum of all this is $x + y + z - xy - xz - yz + xyz$, which is an Indication that the Value of an Annuity to continue as long as any one of three Lives is in being ought to be expressed by $M + P + Q - \overline{MP} - \overline{MQ} - \overline{PQ} + \overline{MPQ}$, and this last Case may be look'd upon as a Confirmation of the Rule given in our 5th Problem.

CHAPTER VI.

Containing the Demonstration of what has been said concerning successive Lives pag. 33. and following.

WHAT has been there said amounts to this ; The present Values of Annuities certain for any particular Number of Years being given, to find the present Value of an Annuity to continue as long as the Sum of those Years.

LET us suppose that M represents the present Value of an Annuity to continue n Years, and that P represents the present Value of an Annuity to continue p Years; the first Question is, how from these *Datas* to find the present Value of an Annuity to continue $n+p$ Years, the Investigation of which is as follows ; let r be the Rate of Interest, and suppose $r-1$ which denotes the Interest of 1 $l.$ $= d$, then,

$$1^{\circ}. M = \frac{1 - \frac{1}{r^n}}{d}, \text{ therefore } \frac{1}{r^n} = 1 - dM,$$

and

and for the same Reason $\frac{1}{r^p} = 1 - dP$.

Therefore $\frac{1}{r^{n+p}} = \overline{1-dM} \times \overline{1-dP} = 1 - dM - dP + ddMP$. Let now S be supposed to be the Value of the Annuity which is to continue $n + p$ Years, then $\frac{1}{r^{n+p}} = 1 - df$. Therefore $1 - df = 1 - dM - dP + ddMP$; then subtracting Unity on both Sides, dividing all by d , and changing the Signs, we shall have $f = M + P - dMP$.

2°. By the same Method of Process, it will be easy to find that if M , P , Q , represent Annuities to continue for the respective Number of Years n , p , q , then the Value of an Annuity to continue $n + p + q$ Years will be $M + P + Q - dM - dP - dQ + ddMPQ$, the Continuation of which is obvious.

LET us now suppose that the Intervals n , p , q , are equal, then the Values M , P , Q are also equal, in which case, the foregoing Canon will be changed into this, $3M - 3dMM + d^3M^3$, or $\frac{3dM - 3ddMM + d^3M}{d}$,
P but

but if this Numerator be subtracted from Unity, the remainder will be $1 - 3dM + 3ddMM - d^3M^3 = \overline{1 - dM^3}$, and subtracting this again from Unity, the original Numerator will be restored, and will be equivalent to

$1 - \overline{1 - dM^3}$, and consequently, if M represents the Value of an Annuity to continue a certain Number of Years, then $\frac{1 - \overline{1 - dM^3}}{d}$ will represent the Value of an Annuity to continue three times as long.

AND universally, if M stands for the Value of an Annuity to continue a certain Number of Years, then $\frac{1 - \overline{1 - dM^n}}{d}$ will represent the Value of an Annuity to continue n times as long.

AND if n were infinite, I say that $\overline{1 - dM^n}$ would be $= 0$, from whence the Value would be $= \frac{1}{d}$ or $\frac{1}{r-1}$, which represents the Value of the Perpetuity.

BUT

APPENDIX. 107

BUT that there may remain no scruple about what we have asserted above, that in the Case of n being infinite, $\overline{1-dM}^n$ would vanish; I prove it thus, $\frac{1}{d} > M$, therefore $1 > dM$, therefore $1 - dM$ is a Fraction less than Unity: now it is well known that a Fraction less than Unity being raised to an infinite Power, is nothing, and was therefore safely neglected.

CHAPTER VII.

Containing the Demonstration of what has been asserted in the Pages 73 and 74, concerning half-yearly Payments, as also the Investigation of some Theorems relating to that Subject.

IT is well known that if an Annuity A is to continue n Years, the present Value of it is $\frac{A - \frac{A}{r^n}}{r - 1}$; supposing r to represent the Rate of Interest;

terest ; now to make a proper Application of this Theorem to half-Yearly Payments, I look upon n as representing indifferently the Number of Payments and the Number of Years ; let us now suppose a half-Yearly Rent B of the same present Value as the former, and to continue as long, then the Number of Payments in this case will be $2n$, but the Rate of Interest, instead of being r , is now $r^{\frac{1}{2}}$, which being raised to the Power $2n$, will be r^n as before ; for which Reason the present Value of

the half-Yearly Payments is $\frac{B - \frac{B}{r^n}}{r^{\frac{1}{2}} - 1}$,

but by Hypothesis, the present Values of the Yearly and half-yearly Payments

are the same ; therefore $\frac{A - \frac{A}{r^n}}{r - 1} =$

$\frac{B - \frac{B}{r^n}}{r^{\frac{1}{2}} - 1}$, and dividing both sides of the

Equation by $1 - \frac{1}{r^n}$, we shall have

$\frac{A}{r - 1} = \frac{B}{r^{\frac{1}{2}} - 1}$, from whence will be de-

duce

duced $B = \frac{r^{\frac{1}{2}} - 1}{r - 1} \times A$; and in the same manner, if the Payments were to be made quarterly, then B would be $= \frac{r^{\frac{1}{4}} - 1}{r - 1} \times A$, and so on.

BUT if we suppose that a Rent shall be paid half-yearly, and that it shall also be one half of what would be given for an annual Rent, and that the two Rents shall be of the same Duration; then the present Values of the Yearly and half-yearly Rents will be different, for let M and P be the present Values of the Yearly and half-

yearly Rents, then $M = \frac{A - \frac{A}{r^n}}{r - 1}$, and

$P = \frac{\frac{1}{2}A - \frac{\frac{1}{2}A}{r^n}}{r^{\frac{1}{2}} - 1}$, and dividing both Values

by $A - \frac{A}{r^n}$, we shall have $M, P ::$

$\frac{1}{r - 1}, \frac{\frac{1}{2}}{r^{\frac{1}{2}} - 1}$, and consequently $P =$

$$\frac{\frac{1}{2} \times \frac{r - 1}{r - 1}}{r^{\frac{1}{2}} - 1}.$$

110 A P P E N D I X.

THE two last Problems bring to my Mind an Assertion which was maintained about six Years ago in a Pamphlet then published, which was, that it would be of great Advantage to a Person who pays an Annuity, to discharge it by half-yearly Payments, each of one half the Annuity in Question; the Reason of which was, that then the time of paying off the Principal would be considerably shortened: I had not the curiosity to read the Author's Calculation, because I thought it too long; since which Time I thought fit to examine the thing, and found that indeed the Time would be shortened, but not so considerably as the Author imagined; which to prove, I supposed a Principal of 2000 *l.* an Annuity of 100 *l.* and the Rate of Interest 1.04: in consequence of which, I found that the Principal would be discharged in 41 Years; this being founded on the general Theorem

$$\frac{A - \frac{A}{r^n}}{r-1} = P, \text{ in which } A \text{ represents}$$

the

APPENDIX. III

the Annuity, P the Principal, r the Rate of Interest, and n the Number of Years; now to apply this to the Case of half-yearly Payments, let us suppose that p denotes the Number of Years in which the Principal will be discharged, therefore $2p$ will be the Number of Payments; $\frac{1}{2}A$ the Annuity, and $r^{\frac{1}{2}}$ the Rate of Interest: which being respectively substituted in the Room of n , A , r , we shall have

$$\text{now } \frac{\frac{1}{2}A - \frac{\frac{1}{2}A}{r^n}}{r^{-1}} P = \text{but } r^{\frac{1}{2}} \rightarrow 1 =$$

0.019804, which being supposed $= m$,

we shall have $\frac{1}{2}A - \frac{\frac{1}{2}A}{r^p} = mP$, and $\frac{\frac{1}{2}A}{r^p}$

$= \frac{1}{2}A - mP$, or $\frac{50}{r^p} = 10.392$; there-

fore $\frac{r^p}{50} = \frac{1}{10.392}$, or $r^p = \frac{50}{10.392}$, and

$p \log. r = \log. 50 - \log. 10.392 =$

0.6822709, therefore $p = \frac{0.6822709}{\log. r}$;

again, $\log. r = 0.0170333$, therefore

$p = \frac{0.6822709}{0.0170333} = 40.05$; and therefore

the

the Advantage of paying half-yearly would amount to no more than gaining one Year in 41.

QUARTERLY Payments, or half-quarterly, nay even Payments made at every Instant of Time, would not much accelerate the Discharge of the Principal. Which to prove, let us resume once more our general Theorem

$$\frac{A - \frac{A}{r^n}}{r - 1} = P; \text{ let us now imagine that}$$

the Number of Instants in the Year is $= t$, let us further suppose that s is the Number of Years in which the Principal will be discharged, then in the room of A , writing $\frac{1}{t}A$; in the room of

r , writing $r^{\frac{1}{t}}$; and in the room of n ,

$$\text{writing } st, \text{ we shall have } \frac{\frac{1}{t}A - \frac{\frac{1}{t}A}{r^s}}{r^{\frac{1}{t}} - 1}$$

$= P$. But it is known, that if t represents an infinite Number, such as is the Number of Instants in one Year, then

then $r^{\frac{1}{t}} - 1 = \frac{1}{t} \log. r$, we have there-

fore $\frac{\frac{1}{t} A - \frac{1}{t} A}{r^s} = P$, or $\frac{A - A}{r^s} = P$; let

the Logarithm of r be supposed $= a$,

therefore $A - \frac{A}{r^s} = aP$, and $\frac{A}{r^s} = A -$

aP , and $r^s = \frac{A}{A - aP}$, which, suppose,

$= Q$, then $s = \frac{\log. Q}{\log. r}$: But it is to be

noted, that a represents the hyperbolic

Logarithm of r , which is, as we have

seen before, 0,0392207 when r stands

for 1,04; this being supposed, the Lo-

garithm of Q will be found to be

0,6663794, which being divided by

the Logarithm of r , *viz.* 0,0170333,

the Quotient will be 39,1 Years; but

in this last Oepration the Logarithms

of Q and r , may be taken out of a

common Table.

CHAPTER VIII.

Containing the Demonstration of what has been said concerning the Probabilities of Survivorship.

WHAT I call Complement of Life having been defined before pag. 2. I shall proceed to make use of that Word as often as occasion shall require.

HYPOTHESIS.

Let it be supposed that the Complement of Life *AS* being divided into an infinite Number of equal Parts representing Moments, the Probabilities of living from *A* to *B*, from *A* to *C*, from *A* to *D*, &c. are respectively proportional to the several Complements *SB*, *SC*, *SD*, in so much that these Probabilities may respectively be represented by the Fractions $\frac{SB}{SA}$, $\frac{SC}{SA}$, $\frac{SD}{SA}$ &c. This Hypothesis being admitted, the

APPENDIX. 115

the following Corollaries may be deduced from it.

COROLLARY I.

THE Probability of Life's failing in any Interval of Time AF is measured by the Fraction $\frac{FA}{SA}$.

COROLLARY II.

WHEN the Interval AF is once past, the Probability of Life's continuing from F to G is $\frac{SG}{SF}$, for at F , the Complement of Life is SF , and the Probability of its failing is $\frac{FG}{SF}$.

COROLLARY III.

THE Probability of Life's continuing from A to F , and then failing from F to G is $\frac{SF}{SA} \times \frac{FG}{SF} = \frac{FG}{SA}$.

COROLLARY IV.

THE Probability of Life's failing in any two or more equal Intervals of
 Q_2 Time

116 APPENDIX.

Time assigned between A and S are exactly the same, the Estimation being made at A considered as the present Time.

THESE things premised, it will not be difficult to solve the following Problem.

Two Lives being given, to find the Probability of one of them fixed upon, surviving the other.

FOR, let the Complements of the two Lives be respectively $AS = n$ and $FS = p$, upon which take the two Intervals AB , $FC = z$, as also the two Moments Bb , $Cc = z$.

THE Probability of the first Life's continuing from A to B , or beyond it, is $\frac{n-z}{n}$; the Probability of the second's continuing from F to C , and then failing in the Interval Cc , is by the third *Corollary* $\frac{z}{p}$, therefore the Probability

bability of the first Life's continuing during the time AB or beyond it, and of the second's failing just at the end of that Time is measured by $\frac{n-x}{n} \times \frac{x}{p}$
 $= \frac{nx - \frac{1}{2}xx}{np}$, whose Fluent $nx - \frac{1}{2}xx$ will express the Probability of the first Life's continuing during any Interval of Time or beyond it, and of the second's failing any time before or precisely at the end of that Interval.

LET now p be written instead of x , and then the Probability of the first Life's surviving the second, will be $\frac{np - \frac{1}{2}pp}{np} = 1 - \frac{\frac{1}{2}p}{n}$.

FROM the foregoing Conclusion we may immediately infer that the Probability of the second Life's surviving the first is $\frac{\frac{1}{2}p}{n}$.

BY the same method of arguing, we may proceed to the finding the Probability of any one of any Number of given Lives surviving all the rest, and thereby verifying what we have said in *Pag.* 43 and 44.

A
 VALUATION
 OF
 ANNUITIES
 FOR
 LIVES, &c.

SOME Time ago, I publish'd an Essay on the Method of ascertaining the Value of Annuities, and of Leases reduced to Annuities certain, for one or more Lives; and therein I laid down this Position as the Ground-work, *viz.* that the even Chance of the Duration of a Life, computed once only for the whole Life, was the sole true Measure of the Value of an Annuity

B

depending

depending on that Life. But since some Persons have made Observations on this my Method, and others have formd Valuations of these Estates, and have defended and still adhere to the Method prescribed by Dr. *Halley*; I think it will not be amiss to make some Remarks upon them, partly to answer and remove the Objections which have been offerd, but chiefly, because it gives me an Opportunity to maintain and further confirm the fundamental Position.

Amongst my Adversaries Mr. *H. B.* appears to be most potent, and indeed the only one who deserves any serious Consideration; and the Question between him and me is, Whether Dr. *Halley's* Rule or mine be the righter, for forming an Estimate of the Value of Annuities on a single given Life. The Dr's Rule is to find the Value of the Annuity for each Year of the given Life to an 100; which is done, and can be no otherwise done, but by computing the Chances of Mortality arising in each Year, and deducting the Value thereof out of the Value of an Annuity absolute for that Year, and then to put together all the Values so collected, and the Sum total is the Value of the Annuity for the given Life. Mine is, to find to what Term of Years any Life is equal, or an even Chance may probably continue; and the Value of an Annuity for the given Life will be the same as the Value of an Annuity for that Term of Years.

Now if my Rule be a right one, and from the slender Objections made to it, and the weak
Defence

Defence of the other by this Advocate, and, if this other could be defended, by this Hand it would have been defended, I am fully satisfied that it is a right one; this my Rule, and the Tables form'd upon it, will have a manifest Advantage over any other Rule, and any Tables that have been or can be plannd from thence. By the other Rule, if the Value of an Annuity for a given Life, is to be computed, the Computer, on every Variation of the Rate of Interest, whether real or on Supposition only, must, of Necessity, calculate the Value of the Annuity for every individual Year, to which the Life of the Person nominated may possibly continue, for each Year separately and distinctly, tho' it should happen to be 80, 90, or an 100 Years; and believe me, those who have tried it, have found this not only a tedious, but very intricate Affair: Nay, this elaborate and perplex Calculation does not attend only on every Change of the Rate of Interest, but occurs again in some Measure on every Age of Life, tho' it differs one Year only, and even tho' the Rate of Interest is, or is supposed to be, the same. On the other Side, and upon my Rule, let the Rate of Interest vary as often or as much as you will, either in Practice or Imagination, yet the Chance of the Duration of a Life of one and the same Age, in one and the same Country, will not vary, but perpetually be the same, and equal to the same Term of Years, and such Term of Years appears in my Tables on the first View.

These Tables go farther, and show what is the Value of such Term, that is, what is the Value

of the Annuity for the given Life at the Rates of 3, 4, 5, and 6 *per Cent.* Interest. And if we could suppose that the Interest of Money should fall from 3 to $2\frac{1}{2}$, or to 2, which I do not suspect will ever be the Case, at least not so soon as some People vulgarly imagin; yet the Term, to which the given Life is equal, will be perpetually the same, and will appear in these Tables; and, such Term being once known, the Value of such Term will be easily found out by the common Tables, which shall then be in Use, for the Value of Terms for Years, at the Rates of 2 or $2\frac{1}{2}$; for I make no Doubt, but that, if and when those shall become the common Rates of Interest, such Tables will be constructed, for they are very easily constructed, and will be in every body's Hand.

Mr. H. B. begins his Attack on the Essay, with some Observations on the Table for Annuities on a single Life; but since I have thought fit, for the Reasons which I shall hereafter mention to alter it, there is no Need to take any Notice of them. From my Table he proceeds to consider the Rule which I just now mentiond, and says, he will give a few Reasons why he thinks the very Foundation I go upon is wrong, and the Rule I first lay down not a right one. I am very much obliged to the Gentleman, that he will give but a few Reasons against the Rule; and more so, that he has reduced those few to one; but he is Master of his own Reason. The Rule I have already set forth; and the Instance I gave of it, which 'tis necessary to repeat here, because of frequent References

ferences to it hereafter, was this: The Number of Persons of the Age of 10, of which we will suppose *A* to be, by a Calculation made on the *Breslaw* Table, is 661; the Half of this is $330\frac{1}{2}$; and this Number we find between 51 and 52, so that *A* has an even Chance to live 41 Years and something over. A Term for 41 Years Interest computed at 6l. per Cent. is in Value 15—12 Centesimals; therefore an Annuity for the Life of *A*, who has an even Chance to live 41 Years and beyond, must be worth 15—12 Centesimals and above. This Author admits the Premises to be true; viz. that *A* has an even Chance to live 41 Years; that a Term for 41 Years is in Value 15—12; but denies the Conclusion, viz. that an Annuity for his Life is worth 15—12. His Reason for denying this Conclusion runs thus: *That, tho' the Chances of A's dying before 51 or after 51 are equal in Number, yet they are not equal in Value.* He then establishes the Truth of this Position by a Demonstration, in two several Instances, and from thence, without further Proof or Allegation, concludes: *Consequently, an Annuity for A's Life, who has an even Chance to live 41 Years and beyond, is not worth as much as an Annuity for 41 Years absolute, that is, is not worth 15—12, Q. E. D.*

When he says, that these Chances are of unequal Value, I suppose he means, that the Annuities, attendant on those Chances for each Year, are of unequal Value; and he cannot well mean any Thing else, because in any other Sense the Position is not true; he might have saved himself the

Trouble

Trouble of a Demonstration, that these Chances are of unequal Value, since the Annuities attending them are Part in Possession, and Part in Reversion; and, to be sure, there could not be Occasion for a Demonstration, at least, not in two Instances, to have shown that the Annuities for a Year of a Life must be of more or less Value, as they are more or less removed from the first Year's Annuity; for Instance, that the present Value of an Annuity for the seventh Year of a Man's Life is greater than the Value of the like Annuity for his twentieth Year. Admitting then, that these Chances, or the Annuities attending them, are of unequal Value, to which, after such an irrefragable Proof as two Demonstrations, I shall certainly submit; Does it follow from thence, that the Rule and the Values produced by it are wrong? This is the Conclusion which he draws; but, as I apprehend, long before he is come at it, for these Premisses and these Demonstrations do no more prove it, than they do, that the three Angles of an equilateral Triangle are equal to two right ones. He admits that the Rule does not direct to put in more Chances in Number, than the Annuitant has a Right to; and he does not so much as assert, that it takes in any Chances of greater Value than he has a Right to; and this ought not only to have been asserted, but proved too, otherwise the Consequence he draws is a strange one; for the Argument, as it now stands, is no better than this: An Annuitant, by this Rule, has no more Chances in Number than he has a Right to;

but,

but, in Fact, there are some Chances of greater Value than others, without proving or even asserting, that any such Chances of greater Value are inserted in the Computation. Now since the Matter in Dispute is not, whether such Annuitant, by Virtue of the Rule, has more Chances in Number, but whether he has some better in Value, than he has a Right to: This is evidently to beg the Question, and not to prove it, notwithstanding the terrible Sting at the Tail of it; for the Demonstrations plainly go to one Proposition, *viz.* to prove this or that is the Value of such Chances; and the Argument concludes to another, *viz.* to such and such Chances the Annuitant has a Right, and no other.

However, to help out a lame Argument, for such I must call it, as here formd, I will admit, that the Rule does direct to put in, and that the Value produced thereby does include, all those Chances which arise on the Life of *A*, before he arrives at the Age of 41; and that the Chances, so inserted, are of greater Value, than those which arise after he is past 41 Years. But not one Word of Proof is here so much as offerd, that these greater Values are not the real Values, which an Annuitant on the Life of *A* has the Chance to receive; and in the Essay it is asserted, and so strongly and fully proved, that these greater Values, and no other, are the very Values which such an Annuitant has a Chance to receive, that I cannot well add any thing to confirm it.

But

8 A VALUATION of

But this Author, instead of attempting to invalidate these Arguments, or to prove that the Annuitant on the Life of *A*, who has an even Chance to live 41 Years, has not an even Chance to enjoy his Annuity for as many Years as he has an even Chance to live, that is, 41 Years, or to enjoy those Chances which arise in those first 41 Years of his Life; which he must do, before he destroys the Foundation of my Rule, and yet I may be confident he never will be able to do; instead of this, he very valiantly demonstrates something, which, to be sure no Man did ever make any Doubt of, that the Chances, or the Values attending them, where some are in Possession, and some are in Reversion, are not all of equal Value.

Since this Author is so full of, and so learned in, the Doctrine of Chances, as he calls it, I will take the Liberty of offering to his Consideration an Argument or two, in Behalf of my Rule, according to his Way of Thinking. The Value of the Chances in this Case, depends on, or is one and the same Thing, as, the Value of the Annuities dependant on those Chances. All the possible Chances, which an Annuitant has on the Life of *A*, are agreed to be 661, and of those he has an even Chance to enjoy a Moiety, that is, 330 $\frac{1}{2}$. The Annuities which attend those Chances for the whole Life, are Annuities for a Term of 90 Years, it being supposed possible that he may live for so many Years; the total Value of them for 90 Years, as I compute, is

16-58 Centesimals, and the Value of those in Possession for 41 Years is 15-12, and of those in Reversion 1-45. Since then the Annuitant on the Life of *A*, has an even Chance to 330 $\frac{1}{2}$ Chances on his Life, and the Annuities will attend those Chances; and since these 330 $\frac{1}{2}$ Chances will, and from the Nature of the Life of Man of Necessity must, arise in the first Part of those 90 Years, if they arise at all, and 'tis supposed in the Case to be an even Chance that so many Chances will arise in his Life: He must then of Necessity have the Annuities attending those very Chances, that is, he must have the Annuities for the first 41 Years of Life. This Author, or whoever will undertake to answer this Argument, must show that 'tis possible for an Annuitant on the Life of *A* to have the Benefit of all these 330 $\frac{1}{2}$ Chances, to which Number of Chances he has without Dispute a Right or an even Chance to enjoy, unless he does enjoy those which arise in the first Part of Life, and in immediate Possession, that is, those of the greatest Value; and this I am very sure he cannot show.

Again, These Positions are not contested: That an Annuity for a Term of 41 Years is in Value 15-12; and that an Annuitant for the Life of *A* has an even Chance that *A* lives for 41 Years. 'Tis a Maxim made use of by this Author, and is certainly a true one, that in estimating the Value of Annuities for a Life all the possible Chances of Life must be computed. From hence I argue thus: To estimate the Value

of an Annuity for the Life of *A*, we must compute all the possible Chances on the Life of *A*; the Chance that *A* lives for 41 Years is an even Chance, and consequently is one of the possible Chances on the Life of *A*; therefore to estimate the Value of an Annuity for his Life we must compute this even Chance. The even Chance on this Life is to a Term for 41 Years. A Term for 41 is in Value 15-12. Therefore the Value of an Annuity for this Life is 15-12.

This Author, having by this and by no other Argument demolishd my Rule, even to the very Foundations, as he expresses himself, proceeds to consider Dr. *Halley's* Rule; and, having given it us, pronounces that 'tis most certainly right, my Objections notwithstanding; and, to be even with him, I say, notwithstanding his Defence, that 'tis certainly wrong. One of my Exceptions to his Rule, and which this Writer's Observations on it make necessary to repeat, is this: That the Value produced by his Rule is not the Value of an Annuity for the Life of *A*, but will be the Value of 90 several Annuities or Grants made to 90 several Persons; suppose to N. 1, to N. 2, and so on to N. 90, formd in this Manner, viz. to N. 1 for a Year, if he shall live from 10 to 11 Years of Age; to N. 2 for a Year, if he shall live from 11 to 12 Years Age; and so on successively to N. 90 for a Year, if he shall live from 99 to an 100 Years Age. I then affirm, that the Value of an Annuity for the Life of *A* absolutely, or for 90 Years, if *A* so long lives,

ANNUITIES *for* LIVES, &c. 11

is of a different and much greater Value than the Interest of N. 1, N. 2. and so on to 90, all put together. To this he says, that it would take up too much Time to answer all the Arguments I have brought to support this Assertion. This surely is a very small Reason for not attempting to answer any of them, or the most material of them; and some People will be apt to surmise that he wanted something else rather than Time to answer them. However, to be sure it will be necessary for me to spend my Time in repeating and defending them; so that, since he has left them quiet and unanswered, I shall e'en leave them, in *statu quo*, undefended.

He does indeed afterwards make an Attempt to prove, that an absolute Annuity for this Life, which I contend to be in Value 15-12, is of no greater Value than these several Annuities or Grants, which I suppose to be made to 90 Persons for 90 Years, when put together, that is, not more than 13-44. He says then, that 90 several Annuities granted to *A*, in this manner; the first Annuity for one Year, if he shall live from 10 to 11 Years Age; the second for one Year, if he shall live from 11 to 12 Years Age, and so on successively to a 90th Annuity for one Year, if the Nominee shall live to be an 100 Years old; will be of equal Value with one Annuity granted to him for his Life absolutely: For the Chances of receiving the Annuity will be the same in both Cases, because the Chances of receiving it depend on the Chances of his Vitality. Here he alters

the State of the Case intirely from what I gave ; for whereas I suppose these several Annuities or Grants for 90 Years, determinable at the End of each Year, to be made to 90 several Persons on their several Lives, he supposes these several determinable Annuities to be granted to one and the same Person, and on one and the same Life ; which Alteration manifestly varies the State of the Chances. The Difference between the two Cases is evidently this ; that in the Manner I stated it there are as many Chances of Mortality as there are Lives, *viz.* 90 ; but, in the Case as he states it, there is but one Chance of Mortality, for there is but one Life in the whole, *viz.* the Life of *A.*

He asserts farther, that these several Annuities, as he calls them, *will be of equal Value, whether they are granted by one Person to one Person, or by 90 several Persons to one Person ; and all equal to an absolute Annuity for a Life.* That they are so in the first Case I admit, because the Grants amount to an absolute Annuity for a Life ; but that they are so in the latter Case, as well on the Part of the several Grantors as of the Annuitant, is a Point at least doubtful ; and I shall go farther and affirm, that they are not in all Instances equal, and that the Reason he gives to prove their Equality, *viz.* *That the Chances for paying and receiving is must in both Cases be the same,* is a Fact not in all Cases true, and therefore does not make good his Assertion. In the first Place, if several Grants were made to one and the same Person, *viz.* *A.*
by

by 90 distinct Persons in the manner here supposed, it might be a Question, whether such Grants were properly an Annuity, or a Grant only of so many several Sums in Gross made by so many distinct Persons. With Regard to *A*, the several Sums so granted, when put together, would amount to something which would be equivalent to an Annuity for his Life; but *quoad* each separate Grant, they seem to be no other than a Grant of so many several Sums in Gross. If we construe them as an Annuity for the Life of *A*, a Dispute would then arise between *A* and the several Grantors, whether the greater Sum, *viz.* 15-12, or the less Sum, *viz.* 13-44, was to be paid to the Grantors in proportionable Parts. *A* on his Side may allege, that the Grantors, on their Engagements for the respective Sums to be paid *in futuro*, are to receive no more than 13-44 in the whole, and all put together, because *quoad* them the present Value of the Chances to pay them, severally and distinctly considered, do amount to no more. The several Grantors on the other Side may allege, that *A* on the Purchase of such Grants is to pay for them in the whole, and all put together, 15-12, because *quoad* him the present Value of all the Sums put together which he has a Chance to receive, by the Combination of their several Grants, amounts to that greater Sum: And, believe me, such their Allegation is founded on very just and good Reasons. If these Grants, supposed to be made by 90 several Persons, are only so many Sums in
Gross,

Gross, they are not pertinent to the present Purpose; and, if we construe them to amount to an Annuity for Life, 'tis disputable at least which of the two Sums is to be paid, the greater or the less; and it may be Time enough to discuss that Controversy when any such Grants shall be made, which is not very likely ever to come to pass; this imaginary Case therefore will avail nothing to determine the Point in Dispute, but it must be left to be decided by other Arguments and upon other Topics.

I affirm then, in the second Place, that this Author's Reason, *viz.* that the Chances of paying or receiving in both these Cases are the same, do not prove that the Annuities in each are of equal Value. In this Matter, the Chances of not paying, or not receiving, are to be taken into the Consideration as well as those of paying and receiving. This being premised, I say, that in the Case of a single Grantor of an Annuity for the Life of *A*, he has only one Chance during the whole 90 Years that he shall be exempted from paying, but the several Grantors have, each in their respective Years, a Chance for such Exemption; consequently the Value of the single Chance of not paying in the first Case is not the same as the Value of the accumulated Chances in the latter; therefore the Value of the Annuities attending is not equal. Each of these Grantors of the Sums in Gross or annual Payments, on their Grants, must be allow'd and have a Deduction for so many Chances as each of them has of not
paying

paying the Sum at the End of each Year, that is, for so many Chances of Mortality as arise on the Life of the Annuitant in each Year respectively. And why is this done? Because the Chance of Mortality *quoad* each of them arises in each Year, and is confined to each Year respectively. But in the Case of a single Grantor, a Grantor of an Annuity for a Life absolutely, or a Combination of Grantors who shall make so many Grants as to be equal to an Annuity for a Life, this Chance of Mortality, and consequently of not paying, does not arise in that Manner, but does, and from the Nature of the Life of Man of Necessity must arise at once, and once only; and consequently on the Purchase an Allowance and Deduction can be made for one Chance only, since it can arise but once. Now that these Chances of Mortality, for which an Allowance and Deduction is to be made, in the Case of the several Grantors, when all put together, are of greater Value than the single Chance of Mortality in the Case of the single Grantor is evident from hence; because the Chances in the first Case arise, some in the first Year, some in the second, and so on successively for 90 Years; whereas the one Chance of Mortality in the latter Case does not arise till the even Chance of the Mortality of *A*, that is, not till the End of 41 Years; and Chances in immediate Possession are of much greater Value than one or the like Number of Chances in Reversion after 41 Years, as this Author has very learnedly demonstrated.

I have

I have supposed here, that a single Grantor of an Annuity for a Life has but one Chance of the Mortality of his Annuitant throughout the whole 90 Years, and most certainly he has not. That every Man shall die once, and no Man more than once, must be admitted; but 'tis absurd to say that a Person has more than one Chance to suffer that which 'tis impossible he should suffer more than once. However, if it be insisted on, in the Case put of 90 several Grants to *A*, that the Chance of receiving the Annuity is the same as in the Case of an Annuity absolutely for his Life, and it seems to be the better Opinion, then *A* has in both Cases the same Chance of Mortality against him, and that is one only: Then it will be insisted on by the other Side, that *A* having by such a Combination of Grants put himself into such a Condition, that he has only a single Chance of Mortality against him, and of not receiving his Annuity, that then for these accumulated Grants he must pay the same Sum as he should do for an absolute Annuity for his Life, that is, the greater Sum.

Hitherto we have been speaking of and considering what would be the Case of *A*, whom we have supposed to be 10 Years old only, on a single Grant of an Annuity for his Life absolutely, and on 90 several Grants to him by 90 Persons, determinable by his Death within any one Year of 90 Years: And, if the Point in Dispute remains there doubtful, the Instance which follows will put the Matter beyond all Doubt. We will suppose

ANNUITIES for LIVES, &c. 17

suppose then that *B* is 80 Years old, that there are 20 Years of possible Life remaining to him, that he has from one Person an absolute Annuity for his Life, and has likewise 20 several Grants made to him by 20 several Persons determinable in the same Manner as in the former Case. The even Chance of the Duration of the Life of *B*, Computation being made of such Chance by the *Breslaw* Table, is 4 Years, or hardly so much; and an Annuity for 4 Years, Interest stated at 6 l. per Cent. is 3-46, an Annuity for the Life of *B* absolutely is therefore in Value 3-46. An Annuity or Grant for the Life of *B*, when made by 20 several Persons for 20 Years, determinable in the Manner aforesaid, is equal to a Term for four Years and an Half, and is in Value 3-84, all which Facts are admitted by this Writer: From whence 'tis evident, as evident as Numbers or Figures can make it, that the Annuities in both Cases are not equal. 'Tis true likewise, and as demonstrable, in the Case of *B*, that the Chances of receiving or paying are not the same in both Instances, unless it be the same Thing to have a Chance of receiving 3-46, as 3-84; or *B* have a Chance of receiving the Annuity for his Life, after he is dead and gone.

He adds farther, that the Chances of Vitality cannot be increased or decreased by the Manner of granting the Annuity: But; I think, he should rather have said, that they ought not, or should not be varied by the Manner of granting, for

'tis visible, that in Fact they are varied in the Case of *B*; for the Chance of Vitality on the single Annuity for his Life is only four Years, and very barely that; but on the Annuity by the accumulated Grants the Chance is four Years and an Half; and 'tis a Contradiction to common Sense to say he has any Chances of Vitality left on the accumulated Annuity, when on the single absolute Annuity they are all determin'd and gone.

I woud here recommend it to this Writer to reconcile these Matters, but that I am afraid he will be sick of his reconciling Function, when he finds, as he will do in an Instance herein after mentioned, how little Success he meets with in such Undertakings. I shall choose rather to observe that this Argument, as weak as it is, is the only one which this Author has offer'd to maintain the Justice of Dr. *Halley's* Rule, for making a Valuation of these Annuities, and proceed to consider what may seem to be alleged by him, in Answer to my main Exception to the Dr's. Rule.

The Exception I mean, and which is the plainest and strongest against the Dr's. Rule, may be reduced to this short Syllogism: Any Rule for computing the Value of Annuities for a Life, which produces such a Value as that one and the same Life shall be equal to a different Term, as the Rate of Interest varies, is a false Rule: This Rule does necessarily produce such a Value: Therefore is a false one. The first Proposition is so clear and obvious a Truth, that this Author
does

ANNUITIES for LIVES, &c. 19

does not offer to contradict it, nay, he goes farther, and by his own Position just mentioned, *viz.* That the Chances of Vitality cannot be increased or decreased by the Manner of granting an Annuity for a Life, he does effectually confirm it; for if, under the Direction of the Rule, such Sums are necessarily produced as the Value of an Annuity on a Life, as that the Term to which such Life is equal, or the Chance of the Duration of such Life, shall vary as the Rate of Interest varies; most certainly this is to make the Manner of granting the Annuities, and the Rate of Interest at which they are granted, to govern and to increase or decrease the Chance of Vitality on that Life. My second Premise I demonstrate by showing that Mr. *Richards's* Tables, which were constructed by that Rule, do in Fact exhibit such a Value of these Annuities. This appears by an Inspection into his Tables, where the Value of an Annuity for a Life of 12 Years old, when Interest is computed at 4 *l. per Cent.* is 17-20 Centesimals, which is equal to a Term of 29-3-00; and when computed at 8 *l. per Cent.* is 10 67 Centesimals, which is equal only to a Term of 25—. To show that these Values do not proceed from any Error or Defect in the Operation made by Mr. *Richards*, but are a necessary Result from the Rule, and consequently the Rule a false one, I advance these two Propositions: That if a certain Value and Term corresponding are given, and out of that Value a proportionate Part be deducted; first, that the Term correspond-

ing to the Value remaining will not bear the same Proportion to the Value remaining, as the original Term does to the original Value; secondly, that the Term corresponding to the Value remaining, after a Deduction at one Rate of Interest, will greatly differ from the Term corresponding to the Value remaining, after a Deduction made at another Rate of Interest: To which I add, that at *4 l. per Cent.* the Difference of the Term is the least, and at *8 l. per Cent.* the greater of the two. To prove these Positions I have subjoind a Calculation which demonstrates them. These Positions and the Calculation this Author has inserted at length in his Observations, p. the 26th, without taking Notice what introduced them, or how they are applied; however, he admits the Truth of them, and that from thence it necessarily follows, if the proportionate Part deducted out of a given Value be an rooth Part only (my Calculation being made on an half Part of the Value) yet that the Term corresponding to the Value remaining, after the Deduction, must be different at different Rates of Interest. But he cannot agree that this is a Demonstration that the Rule is wrong. I did not lay down these Positions immediately and directly to prove that the Rule is wrong, but to prove that the Values given in the Tables were a necessary Result from the Rule; and they do demonstratively prove it, and he admits they do: And then indeed, if the Premises are true, and of one of them he takes no Notice or offers to oppose, and the

the other he cannot contradict without contradicting himself; the Consequence, that the Rule is a wrong one, will follow very close at the Heels of them, for the Conclusion is a necessary and certain one, as necessary and certain as any in *Euclid*: For if the Rule does necessarily produce Values, which are certainly false, the Rule which produces them must necessarily be false likewise.

This Author however, notwithstanding this strong Proof, I may say Demonstration, of the Falsity of the Rule, seeming to offer something against it, I shall consider it. He says then, *that the Rule does not bid you deduct from the Value a Part proportionate to a Part deducted from a Term, but bids you deduct from the Value a Part proportionate to the Number of Chances of Mortality within that Year, which are Things widely different.* 'Tis in no sort material what are not the Directions of the Rule, nor whether they are Things widely different from the real Directions; however, I will admit this Allegation; but this Writer, I suppose, because he could say nothing to the real Question, had a Mind to raise an Imagination, and palm it upon the Reader, that the Question was, whether this or that was the Direction of the Rule, and how far the one might differ from the other. Be that as it will, in the *Essay* 'tis said, and here repeated by this Writer, that one of the Directions of the Rule is this, *viz.* from the Value of an absolute Annuity for a Year to deduct a Part of such Value proportionate to the Number of Chances of Mortality arising in that Year.

Year. Now this is so far from a Reason for not agreeing with me, that it shows, whether he sees it or not, or will acknowledge it, that he does or must agree with me, and proves for me that my Syllogistical Reasoning demonstrates the Falsity of the Rule. The Matter in Controversy is, whether this Rule for finding the Value of Annuities on a Life be a good one; and, having denied it, amongst other Exceptions I alleged this as one, that it directs some Deductions to be made in such a Manner as produces such a Value of these Annuities as make something to happen on the Life of Man, which is absolutely inconsistent with any Thing that ever can happen in the Life of Man. To this the Answer is no more or better than this: That the Rule is a good one, for that it directs these Deductions to be made in the Manner I allege, that is, in a Manner which produces those absurd Values. If the Matter were here fresh, and no Objection had ever been made to the Rule, this woud have been a poor Argument to prove its Goodness; for 'tis in Effect begging the Question, and saying that the Rule and the Directions are such and such, for it does no more than repeat one of the Directions of the Rule, and tell us that it differs widely from another that is no Direction of the Rule, without offering one Word in Justification of it. But now, when he is attempting to answer a Treatise, in which are many Objections to the Rule, and to that very Direction in particular, and in which 'tis alleged, that such and such absurd Values in
certain

certain Tables were produced by following that Direction, and demonstrated that those Values so produced were a necessary Result from so following it: When he tells us that the Rule bids us make the Deductions in the Manner alleged in the Exception; this manifestly confirms the Exception, for it admits the Verity and Justice of the Allegations; and, if those are true, I'm very confident that the Conclusion is right, that the Rule is not a good one.

Another Objection to the Rule mentioned in the *Essay*, and which this Writer's Observations upon it make necessary here to repeat is this: That according to such Rule the Value of an Annuity for a Life of ten Years Age is 13-44 Centesimals, which is equal to a Term of 28-1-00; and the Value of an Annuity for a Life of 80 Years Age is 3-84 Centesimals, which is equal to a Term of 4-2-00; but from the *Bresslaw* Table, from whence this Calculation of these Values was made, it appears that the even Chance of the Duration of the Life of 10 Years Age is 41 Years, and the even Chance of the Duration of the Life of 80 Years is not full 4 Years. From thence it was argued: That an Annuity for the Life of a Person aged 10 Years should be in Value 13-44. that is, should be equal to a Term of 28-1-00 only, when his Life on the even Chance of Duration is equal to 41 Years and above; and at the same Time that an Annuity for the Life of a Person aged 80 should be in Value 3-84. which is equal to a Term of

4-2-00;

4-2-00, when his Life on the even Chance of Duration is equal only to a Term of 4 Years: This is there said to be so palpable a Contradiction to common Sense, that nothing can maintain the Rule by which those Values were produced. The Jet of the Argument, lies in this, and on this the Contradiction is grounded, *viz.* That the same Rule should in the Operation have such different Effects on the younger Life and the elder Life as to depress the Chance of Vitality of one below the even Chance, and exalt the other above it; which, in Effect and in other Words, is as much as to say, that in the one Case the Annuity will not have a Chance to continue so long as the Life will have a Chance to continue, and in the other Case will have a Chance to continue longer than the Life does: And, notwithstanding the learned Labors of this Author to reconcile this Matter, I think, and I believe most others will think, that it remains still in the same State of Inconsistency.

Let us now examin his Way of Reasoning here. He admits the Values of the Annuities, and the Chances of the Duration of the Lives, respectively, to be such as I have stated them; but a Repetition of those Computations, merely and by itself, sure enough does not prove either that the Values produced are the true Values of the Annuities, or that the Rule by which they were computed is a right one. This is neither better nor worse, than first to suppose and take for granted, that these Values thus produced are the
true

ANNUITIES for LIVES, &c. 25

true ones, and then to infer that the Rule by which they were computed is a right one; or *vice versa*, to suppose and take for granted that the Rule by which they were computed is a good one, and from thence to infer that the Values are true ones; but this will not have much Weight with those who deny both that the Rule is a good one, and that these Values are the true ones.

However, to justify the Value given on the younger Life he urges, *p.* the 33^d, that, when all the possible Chances are considerd, they will reduce it to an Equality in Value with a Term of 28-1-00. I observe here, that he speaks only of the possible Chances of Vitality, and not of the Value of those possible Chances; and I say, that all the possible Chances of Vitality have been considerd, and upon a Computation of them, it appears that 'tis an even Chance, that the Life will have Continuance for 41 Years, and this he will and does admit; therefore 'tis incumbent on him to prove that 'tis not an even Chance or Probability that the Annuity, which is to continue for the Life, will have a Duration for the same Term, as 'tis an even Chance or Probability that the Life will have a Duration, that is, for 41 Years: And until he does this, which I despair of ever seeing done, for indeed 'tis impossible to be done, the Difficulty will remain.

To justify the Value given on the elder Life, which seems to be the harder Piece of Work, he gives us, *p.* the 33^d, a Computation of som of the possible Chances on such a Life, and refers us to *p.* the 18th for a like Computation on som of

the like possible Chances on the younger Life; and then concludes: *That it will be no Contradiction to common Sense to say, that the Values of these two particular Annuities, produced by the Dr's Rule are the true Values of the Annuities on these Lives respectively: Because in estimating the Value of an Annuity on a given Life all the possible Chances must be computed; and the Chances in the Case of the elder Life have a different Operation from what they have in the Case of the younger Life.* If he means here no more than that all the Chances of possible Life must be computed, as his Words import, I shall readily agree with him, because we cannot compute the Value of an Annuity for a Life without estimating first the Chance of the Duration of that Life, and we cannot rightly estimate that Chance without computing all the possible Chances of that Life. When that is done according to the Rule laid down in the *Essay* for estimating the Value of Life Annuities, a Moiety of all the possible Chances gives us the even Chance of the Duration of the Life, the even Chance of the Duration of the Life gives us the Term to which the Life is equal, and that gives us the Value of the Annuity. But if he means here that the **V.A.L.U.E** of all the possible Chances on the Life are to be computed, and the possible Chances of a Life and the Value of those possible Chances are quite different Things, and will produce Annuities of very unequal Value; and this latter he must mean, if he intends to support the Dr's Rule, for the Direction of that Rule is to take the **V.A.L.U.E** of all the possible

Chances

ANNUITIES for LIFE &c. &c.

Chances of Life; then he begs the Question, according to Custom, instead of proving it. The Objection to the Rule was this; that it produces such Values of Annuities, as that in the one Case they necessarily suppose the Chance of the Duration of the Annuity to fall short of the even Chance of the Duration of the Life, and in the other to exceed it; and these Values of Annuities are in the *Essay* asserted, and most People I believe will agree, to be absurd ones. 'Tis there demonstrated, that these Values of Annuities are produced by the Rule, and particularly by its directing, or because it directs, that the VALUE of all the possible Chances on Life be computed; and he concludes here that the Rule is a good one, without more saying, than that 'tis a good one, because it directs the Computation of the Value of such Chances to be made in a particular Manner, which Manner necessarily produces such a Value of these Annuities as are manifestly absurd ones.

I have said that the possible Chances of a Life and the VALUE of those Chances are different Things, and so most certainly they are; and that this Author does not see it, or may not be ready to acknowledge it, that there is in Truth the Matter in Controversy, whether the Computation is to be made by the possible Chances of a Life, or by the Value of those possible Chances. I say 'tis to be made in the first Manner, and that such Computation will give us the Duration or Chance of the Duration of the Life; that the Duration of the Life is the Measure of the Duration of the Annuity depend-

40 VALUATION of

ing on that Life, and the Duration of the Annuity the Measure of the Value of it. On the other Side, if a Computation be made of the VALUE of such possible Chances, that is done, and can be done no otherwise, than by computing the Value of the several Annuities attending on such possible Chances in every Year of Life, and through the whole Life, and then assuming that those several Annuities put together constitute the Value of the Annuity for the the Life. Now this does directly and obviously make the Chance of the Duration of the Life to depend on the Value of the Annuity; for, in every Computation which has been made of the Value of Annuities on Lives constructed in this Manner, we have seen that the Fact is such, that in all Instances where the Interest is varied, and consequently the Value of the Annuity varied, there the Chance of the Duration of one and the same Life is varied likewise, and that the one increases or decreases when and in Proportion as the other does; and yet 'tis most undoubtedly true, and this Author asserts it, over and over again, that the Value of the Annuity is not to increase or decrease, or in any Shape to have an Influence on the Chance of the Duration of the Life, and yet in Practice he generally contradicts it.

He adds farther, that the possible Chances in the Case of the elder Life have a quite different Operation from what they have in the other Case of a younger Life, and from thence woud infer that

ANNUITIES for LIVES, &c. 29

that the Values of the Annuity on these two Lives are or may each be right ; but this surely is a strange Inference, for he gives that as a Reason for the Rectitude of the Rule and for the Truth of the Values, which I have given, and most certainly is a good one, for Falsity of both. When I considerd the Value of the Annuity on these two Lives as produced by one and the same common Rule, I said that it could not be a good one for estimating the Values, and gave this Reason for it, *viz.* because in the Operation upon it the Effects in the Case of the younger Life, and in the elder were so different, as to depress the Chance of Vitality on one Life below the even Chance, and to exalt the other above it. The Answer he gives to this is no more than a bare Repetition of the Grounds of my Objection to the Rule and the Values in these Instances produced by it, with some small Difference in the Expression, *viz.* the Rule is a good one, and the Values of these Annuities are right ; because the Value of the possible Chances, which the Rule directs to be computed, have a different Operation in the younger and in the elder Life. This, I say, is and will remain an unanswerable Objection to the Rule, until it can be shown, and I may be confident it can never be shown, that the Value of these possible Chances, or rather the Value of the Annuities attending those Chances, can in some Instances abridge the Chance of Vitality so as to make it less, and in other Instances enlarge it so as to make it greater than the even Chance : Or, as this Author expresses

presses himself, that the Manner of granting these Annuities, whether on a younger or on an elder Life, can increase or decrease the Chance of Vitality. That the Operations on the Value of the possible Chances on the younger and the elder Life, in their Way of computing them, have different Produces is a Thing visible, and is the Matter of the Objection or the Grounds of it; and to answer this the Author should have shown such a Difference between the Nature of the Life of the young Person, and the old one, as should reconcile this Difference in the Produces; but that being impossible to be done, as most certainly it is, for the Chance of Vitality of one to 41 Years is the very same Thing, and collected in the same Manner, as the Chance of Vitality of the other to 4 Years, he contents himself with repeating the Substance of the Reason and Grounds of the Objection, and there leaves the Matter.

However, to be more particular; he attempts to show that $13^{\cdot}44$ may be the Value of an Annuity for a Life of ten Years Age, and $3^{\cdot}84$ the Value of one for a Life of 80, tho' neither of them be consistent with the even Chance of Vitality of the respective Lives, which he must and does admit. For this Purpose he makes a Computation of the Value of the Chance which *A*, for Instance, supposed to be 10 Years old, has whether he shall die in the first Year, or live to be 90 Years old, and the Sum arising is 1-59. He makes the like Computation of the Value of the like Chance on the Life of *B*, for Instance, supposed

posed to be 80 Years old, and the Sum arising there is 4-5. If we inquire how the Computations of the Values of these particular possible Chances on these two Lives made by this Author, and his Reasoning upon them, are to be applied; I can make nothing other or farther of them than this.

The Dr's Rule for estimating the Value of Annuities a Life may be a right one, altho, in computing the Value of the possible Chances of these two Lives, the Produces are so different as not to coincide with the even Chance of Vitality, which is the Point he undertakes to prove; for here is a Rule, he says, of his own, for computing som of the particular possible Chances on these two Lives, and on the Computations made thereby it appears that one is in Value 1-59, and the other 4-5. Very true; but these two Values do in Fact coincide with the even Chance of Vitality, as we shall see presently, and he himself says they do, and takes som Pains to prove it. The Argument then will stand thus: This Observer's Rule for computing the partiular Chances on these two Lives is a good one, as I do admit it is; because the Values produced by the Rule do coincide with, and are computed by the even Chance of Vitality; therefore Dr. Halley's Rule for computing the Value of the Chances for the whole Life (or of an Annuity for the whole Life) of these two Persons is a good one, which produces such Values as do not in either of them coincide with the even Chance of Vitality. I shoud speak too favourably

of these two Computations, and the Application of them to the present Purpose, if I should say of them only that they prove nothing towards maintaining the Doctor's Rule; for some People will be apt to surmise that they prove rather the contrary, that no Computations on the possible Chances of Life, or the Values of them, are right but what do coincide, or at least are consistent, with the even Chance of Vitality of Life.—

To support such Surmise of theirs, they make Use of the two Computations made by this Writer to show that the Sums 1-59 is the Value of one of the Chances, and 4-5 the Value of the other; but, since they are both formed by the same Pattern, I will mention one only—He says, then; *That the Number of Persons dying in the first Year of the Life of A is 8, the Number of Persons living of the Age of 90 is 8; consequently it is an even Chance whether A is one of the first 8, or one of the last 8; that is, the Chances of A's dying the first Year, or living to 90, are equal. If he dies the first Year, he loses the Value of an Annuity for 41 Years, which is worth 15-12 Centesimals; whereas, if he lives to 90, he wins the Value of an Annuity for 39 Years, in Reversion after a Term for 41 Years, which is worth no more than 1-59 Centesimals.* I observe here that this Author, as great a Master as he is of Numbers and Figures, is guilty of a Mistake in computing the Value of the reversionary Interest of the 39 Years, and stating it at 1-59, when 'tis only 1-38; for the whole

Whole Term of 80 Years is, in the common Tables, set at 16-50 Value; and, since the Interest of 41 Years in Possession is 15-12, the Interest of the 39 Years in Reversion can be no more than 1-38. But to let that pass, for in the present Argument 'tis not at all material which is the truer Value; and we will suppose 1-59 to be the right one; I admit then that the Number of Chances are equal; that the Chance here is an even one; and that 1-59, the Sum produced, is the right Value: But it happens very unluckily that this Argumentation, when applied to the present Purpose, does directly and evidently prove my Position, and destroy the other. Mine is, that the even Chance of the Duration of the Life, computing one Chance only in the whole Life, is the Measure of the Value of the Annuity for that Life; and Dr. *Halley's* and this Author's is, that the Value of the Chance for each Year of the possible Life, computing as many Chances as there are Years in the possible Life, is such Measure. Now in the Case here stated 'tis supposed, as the Foundation of the Truth of the Value produced, that the Chance is an even one; and in the Computation itself 'tis taken for granted, that the Chance of the Duration of the Life is the real Measure of the Value of the Annuity for the Life. 'Tis here laid down that *A. by his Death in the first Year will lose an Annuity for 41 Years which is in Value 15-12; but by his Death at That Time he can lose nothing but an Annuity for his Life, for he can*

lose nothing but what he has a Right or a Chance to have, therefore such Annuity must be equal to a Term for 41 Years, and be in Value 15-12. And since the even Chance of the Duration of the Life is a for a Term of 41 Years, and a Term for 41 Years is in Value 15-12, and the Loss by his Death in the first Year is such a Term and such a Value: It follows from thence, that the Chance of the Duration of the Life is here made the Measure of the Value of the Annuity for the Life, according to my Position.

I cannot forbear observing here, how naturally and easily this Author falls into the Notion, that the Chance of the Duration of a Life is the Measure of the Value of an Annuity on such Life; for his Reasoning is formed on Purpose to prove that such Chance is not the Measure, and that 15-12, the Sum produced by such Rule, is not the Value; yet even here he supposes that Sum to be the true Value of the Annuity, tho' at the same Time he makes Use of it as the Medium to prove that 'tis not the true Value. If then 1-59 be the Value of this particular Chance on such Life, and for that Reason, viz. because 'tis an even Chance, I don't see why I may not conclude that 15-12 is the Value of an Annuity for the younger Life, and 3-46 of an Annuity for the elder Life, beforementioned: For the even Chance is that the younger Person does not die before the End of 41 Years, and a Term for 41 Years is in Value 15-12; and the even Chance is that the elder Person dies in 4 Years, and a Term

Term for 4 Years is its Value 3-46. On the other Side, and from hence, I think I may infer that the Values of the Annuities on these Lives produced by Dr. *Halley's* Rule must be false, since one falls greatly short of the Value of the even Chance of the Duration of the Life, and the other exceeds it. Therefore, upon the Whole, I recommend it to the Author of these Observations, and leave it with him, to answer his own Arguments, as well as mine, for my fundamental Position; that the single Chance of the Duration of a Life, computed once for all his Life, is a good Rule, and the only Rule, to compute the Value of an Annuity depending on that Life.

I must, in the next Place, take Notice of the Remarks made on the Essay made by Mr. *Ritbards*, often therein mentioned; were it only to let him know that I have read them; but that I despise the foul-mouthed and scurrilous Language which he has so plentifully bestowed on me and my Performance, and for his Arguments and Objections against it, as he calls them, that I think they are already answered or obviated, as far as the Matter of them deserves and requires. All I shall add is, that I would recommended it to him to look into his own first Treatise on this Subject, if he thinks it worth his Trouble, which few perhaps besides himself will do, and compare what he says in P. 27 and 28. with what he says in P. 83, &c. In P. 27, having made a Supposition that three Persons are to enjoy an Estate by equal Portions during their joint Lives, Re-

mainder to the Survivors and Survivor, he makes a Quere what is the Value of each Man's Right ; and, in the next Page, solves it thus—*That each Person has a Right to one Third of the Value of their joint Lives, and so Half the Value of the Expectation after the Decease of either of the other two, and also to the whole Value of the Expectation of both the others ; which three Sums added together give the Value for each.*—In P. 83, &c. he supposes a Man to give his three Daughters an Annuity of 20*l.* per Annum each for their Lives ; and to order, that, when any of them dies, the Annuity of the Sister dying should fall to the other two in equal Shares ; and, at the Death of another, that the whole should belong to the Survivor for her Life. He goes on then to compute the Value of this Gift to each of these Women ; and gives us the Value of the Share of the eldest Sister thus :—First, 20*l.* per Annum during her own Life. Secondly, 10*l.* per Annum in Reversion of the youngest, to continue from thence during the joint Lives of the other two. Thirdly, 10*l.* per Annum in Reversion of the Second, to continue from thence during the joint Lives of the First and Third. Fourthly, 40*l.* per Annum in Reversion of the two youngest Lives during her own Life. Now, unless this Writer does, and until he has reconciled his Solution in the first Passage, in which he allots to each Person three Sums only, with his Computation in the second Passage, where he brings to Account four Sums : Which I suppose he will be in no great Haste to attempt, and,

and, if he does, will never be able to effect: Some People will, perhaps, call in Question his Faculties, Algebraical, Mathematical, or Intellectual, and, for my own Part, I shall never say a Word more to such a ———.

To Mr. *Hodgson*, who stiles himself *F. R. S.* and Master of the Royal Mathematical School, who has lately published som Operations and Tables on the Value of Annuities for Lives, I have something more to say, because he builds, in Part at least, on the same Foundation on which *Dr. Halley* did, and has revived, seemingly, and unnecessarily I think at this Time of Day, the Controversy on the Rule for making the Valuation of these Annuities. In his Preface, by Way of Apology for framing a new Table of Mortality for *London*, to serve the Place of the old one of *Breslaw*; he tells us, that at *Breslaw* one Half of the People that are born there live 'till they are about 41 Years of Age, in *London* that one Half die before they are of the Age of 10 Years. Where and whence this Writer pickd up this Notion about the Age to which the People who are born at *Breslaw* do live, or who should tell him so, I cannot devise; for *Dr. Halley*, in his Treatise on this Subject, tells us, in so many Words, that it appears from the *Breslaw* Table, and in Fact it does so appear, that one Half of those who are born there are dead in 17 Years: But, this not being material to the main Design, let it pass. In his Book, after giving us, for four or five Pages, a Calculation of the Chance of the Duration of
Lives

Lives for *London*; tho' by the Way, this long Detail, even were it a good one, is very little to the Purpose, unless such Chance be the Measure of the Value of the Annuities depending on those Lives; he says, that from thence the Value of an Annuity for a single Life of a given Age, or the Value of any limited Time the Person has a Probability of living, at any Rate of Interest, may be found. He proceeds, by Way of Instance of a Person of 10 Years Age, and at 3*l.* per Cent. Interest; to compute the Value of an Annuity for his Life of 1*l.* per Annum; and having told us the present Value of 1*l.* payable at the End of one Year, when 'tis an absolute Certainty, and computed what must be deducted thereout on the Life Annuity for that Year, on Account of the Chance of Mortality arising in that Year; and having gone through the like Operation on the second and the third Year of the Life of such Person; he concludes, that, *by repeating these Operations to the utmost Extent of possible Life, the Value of 1*l.* per Annum, for a Life of 10 Years old, will be found to be 20-16-46, or 20-16 $\frac{46}{100}$ Years Purchase:* And then adds, that *the Tables there following were constructed after this Manner.* I observe here, that this Method of computing the Value of Annuities on a single Life, tho' it may vary in the Expression and Shape of it, yet in Substance is the same as Dr. *Halley* prescribed for that Purpose; and therefore, that all the Exceptions taken to this Rule, as Dr. *Halley's*, will equally lie against it now adopted and abetted

by

by this Author. This being premised, I say, that this Writer has either himself been imposed on, or attempts to impose upon his Reader, when he tells him that the Tables there following were constructed in the Manner mentioned; for, whatever was the Manner in which they were constructed, 'tis certain it was not this; and he himself shows it demonstratively, and so plainly and palpably, that one may read it as he runs. He says, on computing the Value of an Annuity for a Life of 10 Years Age, the Value or Years Purchase appears to be, when computed by his Method, 20-1646; which I believe to be right, because I have made the Computation on the same Life, at the like Interest, and by his Rule, and I make the Value 20-1623; and this very small Difference may possibly arise by his inserting an Account of the Fractions at the End of each Year, and my omitting them. But in the Table, which follows in the very next Page, he gives 19-5761 as the Value of an Annuity for a Life of 10 Years of Age, Interest computed at the Rate of 3*l.* per Cent. when, in the Paragraph just preceding, he had computed and stated it, and at that Rate of Interest, at 20-1646. Now the Sum 20-1646 is equal to a Term of $31\frac{1}{2}$, and the Sum 19-5761 only to a Term of $29\frac{2}{3}$; so that there is the Difference of a Year and an Half in the Term to which one and the same Life is equal, as computed in the precedent Paragraph and as given in the subsequent Table. At the Rate of 5*l.* per Cent. there is the like Variation, but on the

the contrary Part; for the Value, on computing by the Rule given by this Writer, is only 15-0430, which is equal to a Term of $28\frac{1}{2}$, but in the Tables is put down 15-3588, which is equal to a Term of $29\frac{1}{8}$. At the Rate of 4*l.* per Cent. indeed, the Value arising on a Computation by the Rule and that inserted in the Tables is one and the same, viz. 17-2738, which is equal to a Term of $29\frac{1}{8}$. From these Calculations and Facts, 'tis evident that the Value of this Annuity, at the Rate of 3*l.* and 5*l.* per Cent. was not collected and ascertained on a Computation by the Rule, for they are not agreeable to it; but, on the Contrary, it must have been first supposed that the Values at the Rates of 3*l.* and 5*l.* were equal to the same Term to which the Value at 4*l.* is equal, and then a Value corresponding to that Term is inserted as the Value of the Annuity at the Rates of 3*l.* and 5*l.* The Truth is, and in his Table, P. 40. and which he calls, *The Value of Lives upon Annuities certain*, 'tis manifest, that this Writer did mean and intend that the Value of Annuities for a Life of the Age of 10, and indeed of all other Ages of Life, at all Rates of Interest, should respectively correspond to one and the same Term in an Annuity certain; for this Table exhibits them all, at every Rate of Interest, as equal to one and the same Value in an Annuity certain, which is the same Thing as saying, that they are all equal to one and the same Term in an Annuity certain: And that is the very Point for which I contend, and ought to

to be, but is not preserved, nor can possibly be obtained by Dr. *Halley's* Rule, and in the *Essay* have demonstrated it, tho' by this Author's new-fangled Regulator it may.

Now this Method of constructing the Tables of these Values does not only contradict the Manner by which he says, in the precedent Page, he constructed those Tables, but 'tis likewise an absolute and total Departure from the Rule laid down by Dr. *Halley*, observed by others, and pretended to be assumed by this Author, except in the single Article of *4 l. per Cent.* and is conformable to the Rule laid down in the *Essay*, so far forth as it makes the Term in an Annuity on one and the same Life to be the same as the Term in an Annuity certain, at all Rates of Interest. He does indeed by this Means, in Part, obviate or evade the main Objection made to Dr. *Halley's* Rule, but we shall see presently that my Exception to this Method remains as strong, at the Rate of *4 l. per Cent.* as it does against the old Rule, where the Rate of *6 l. per Cent.* is used. The Exception I mean is, that, by Virtue and in Pursuance of the old Rule, such a Sum is produced as the Value of a Life Annuity, as that one and same Life shall be equal to a different Term as the Rate of Interest varies; and it is demonstrated that this must be the Case, and admitted so to be by Mr. *H. B.* whom I have beforementioned; and consequently that the Duration of a Life or the Chance of it depends on the Rate of Interest; and must, and in Fact is found to vary as oft as that

varies. Since then the Term in the Value of an Annuity at every other Rate of Interest different from it is by this Method to be affixed and brought to the Standard of the Term in the Value of an Annuity at the Rate of 4 *l.* then the Chance of Duration of Lives depends on that particular Rate of Interest as the common Standard. Now if the Question were asked, on what Pretence or by what Authority this particular Rate of Interest is made the Regulator here, I think no tolerable Answer could be given but this, that at present this is the common Price of Money. Be it so: But what if it should so happen that in 20 or in 50 Years Time, more or less, the Price should alter, and sink to three, or rise again to five? Why, we must then change our Standard as the Case shall come out; and whereas 29 $\frac{7}{8}$ on a Life of ten Years Age is now the Term to which an Annuity on such a Life is equal, then *in futuro*, if the Price should be three, an Annuity on such a Life would be equal to a Term of 31 $\frac{1}{2}$, and, if it should rise to five, would be equal to a Term of 28 $\frac{1}{2}$. If we look backwards, we find the Price of Money about 50 or 60 Years ago to have been six, and about an hundred Years ago eight; and in the first Case the Term in the Annuity for the like Life would be 27 $\frac{1}{4}$, and in the latter about 25, and then these Terms respectively must be looked upon as the Term to which an Annuity on such a Life, at the several Times, and at the different Rates of Interest then courant, must be reduced as to a common Standard. Now this Alteration of the
common

common Standard changes the Chance of the Duration of a Life of one and the same Age, in the same Manner and as effectually as the Change of the Rate of Interest, at any one Time, does change the Chance of the Duration of one and the same Life at that Time: And I believe no Body will be so hardy as to assert, that the Chance of the Duration of a Life of one and the same Age is not the same now as it was 50 or 100 Years ago, or that it will not continue the same for 50 or an 100 Years to come; so that the Difference between the Dr's Rule and this Regulator would be this and no more than this, that by the Use of the former the Chance of the Duration of one and the same individual Life is varied as the Interest varies, and the Life is made shorter or longer, as that is higher or lower; and by the Use of the latter, that such Chance would vary on a Life of one and the same Age, in the same Manner and Proportion; from whence it follows, that this new Regulator is liable to the very same Objection as the old Rule.

This Writer can himself give the best Account, what induced him in his Book to recommend and make an Operation by the Rule, but in constructing his Tables to give it up and desert it, and to fall into this new invented Method; but 'tis suspicious that he saw and felt the Weight of the Exception to the Rule, and not being able to answer it, as I may be confident he was not, he entered into this Practice to elude or to cover it. But, whatever his Reason might be for using these

tifices, he has fail'd of Success; as we shall see presently he has done likewise in putting in Practice the same little Arts, with Respect to another material Exception to the Rule mention'd in the *Essay*. The Exception I mean here is; that in using the Rule prescribed, in the younger Life, the Term, to which the Chance of the Duration of the Life is equal, is longer than the Term to which the Value of the Annuity for the Life is equal: And on the Reverse, in older Life, the Term, to which the Value of the Annuity for the Life is equal, is longer than the Term to which the Chance of the Duration of the Life is equal: And this in the *Essay* was said to be contradictory to common Sense and Reason; and notwithstanding the learned Endeavors of Mr. H. B. in his Observations before-mention'd, to reconcile these Inconsistencies, I still adhere to my former Opinion, and am confirm'd in it, on seeing the great Labor he has taken, and the little Success he has met with, in the Attempt. Let us examin now how this Matter stands on computing the Value of these Annuities by this new Method. In the Case of the Value of an Annuity for a younger Life, suppose of ten Years Age, 'tis equal to a Term of $29\frac{1}{2}$; and the even Chance of the Duration of such a Life is 35 Years, Computation in both Instances being made by this Writer's Tables, so that the Difference amounts to a seventh Part of the whole Term, and something over: But in the Case of an Annuity for the older Life, suppose of 80. Years of Age, 'tis set down as equal to a Term
of

ANNUITIES for LIVES, &c. 45

of 4-9103, which is four Years and eleven Months, wanting about three Days; and if we inquire, to what Term such a Life on the even Chance is equal, this Writer *p. the 9th* says between 4 and 5 Years; in *p. the 7th* five Years; and, if we compute such Chance by his Bills of Vitality and Mortality for *London*, I find, and if any one else will give themselves the Trouble of computing it, as I have done, he will find, that the even Chance is just four Years and ten Months; so that the Duration of the Annuity exceeds the Chance; of the Duration of the Life, as well in Computations by this new Method, as by the old Rule; and therefore both of them absurd and defenceless.

After all, what do these little Subterfuges signify? Even just nothing at all; for Mr. *H. B.* a strenuous Advocate for Dr. *Hally's* Rule, has admitted the Fact to be such as I have stated it on an Operation made by such his Rule, and, on the like Operation by this Writer's Rule, the Fact must come out nearly the same, and consequently my Exception to the old Rule and this new Method will be equally strong, tho' perhaps it may not appear in a Light so clear, even tho' the Chance of the Duration of this Life were supposed to be full five Years, and to exceed the Term in the Annuity, or that the Terms in both were equal. The Way of Reasoning here stands thus; Since by Virtue of the Rule the Term in an Annuity for a Life is diminished and made less than the Term to which the Life on an even Chance is equal, 'tis necessary that a certain and regular

Pro.

Proportion of such Decrease should be preserved through all the Stages of Life; but here, where in younger Life the Term in the Life is 35 Years; and the Term in the Annuity is $29\frac{1}{7}$, and in the elder the Term in the Life is 5 Years (supposing it were so) and the Term in the Annuity four Years and eleven Months, or very near it; the Decrease in one Case is one Year in seven, and in the other one Month only in 55 Months.—And if we should suppose that in some Instance the Term in the Chance of the Life was the same as the Term in the Annuity, which must be the Case in some one Instance, tho' not here: And if it should be said that there the Value of the Annuity would be the right one; I will admit it to be so, and admit it for that Reason, because it has fortuitously happened in that Case, that the Term in the Life and the Term in the Value are the same and coincide. But let us look a little into the State of an Annuity on a Life still older, suppose of 90 Years Age, and see how Matters stand there: The even Chance of such Life, *p.* the 91*b*, is said to be a Term of three Years, and the Value of an Annuity for such Life given in his Tables is 1-8772; but this is not near equal to a Term even of two Years, for a Term of two Years is in Value 1-9135, so that the Difference between them will exceed a whole Year; and consequently the Decrease in this Case is one third at least of the Term, and this is a greater Decrease than in a Life of ten Years Age, for there the Decrease is only a seventh Part of the Term. We find then that to
the

the old Difficulties on the Rule an Addition is here made of another ; and, unless Mr. *Hodgson* can discover a better Solution of them than *H. B.* has done, these Irregularities in the Proportions of the Decreases, believe me, do effectually destroy the Justice of the Regulator.

In the *Essay* very little Notice is taken of Mr. *Hayes's* Method of Valuing Annuities on Lives, because his Tables drawn for that Purpose seemd to me so absurd and wide of the Mark, that I could not think that any one, of tolerable Understanding in Things of this Nature, would be guided by them : But since his Treatise on this Subject has lately received a new Impression, in a very superb Dress, I must say something to it now. I observe he gives us the Age of 30 as the first Age of Life, on which he begins his Valuation of Annuities ; but for what Reason he omits all the Stages of Life precedent to that of thirty I cannot imagin, unless he were of Opinion that the Age of thirty was the best Age of Life : But for this Surmise there's no sort of Foundation in Nature or Experience ; and on the contrary the *Breslaw* Table, the Bills of Mortality for *London*, and those of the Normines in the Government Annuities on Survivorship, which is the best Guide of all, do plainly show, that 'tis quite a vulgar Error. In p. the 1st of his Book, as the Foundation of his subsequent Calculations, he tells us, *that the Annuities, calculated in the following Pages, show, at one View, the present Value upon the Life of any Age from 30 to 73, according to the*
Chance

Chance of an Annuitant's living to the Extremity of the common oldest Age of Life, and this is done upon the Supposition of the various Degrees of Probability, which Lives of different Ages have to continue in Being. In *p.* the 22*d.*, we have a Table, shewing how long an Annuitant must live to receive the Value of an 100*l.* funk, supposed to be given for his Annuity, according to the Chances of Life, at the several Rates of 4, 5, 6, 7 and 8 *per Cent.* Interest: And, in *p.* the 74*th* to 127*th*, we have a Table, a very long Table, for the Value of an Annuity upon a Life from the Age of 30 to 73, at the like Rates of Interest, and these I believe, do very well agree and coincide with each other. But then these two Tables, if right, do manifestly demonstrate, that this Writer's first and fundamental Position is absolutely false; or the Position, if that be right, as undoubtedly it is, demonstrates that the Tables are all false, for these Tables could not be framed, and 'tis visible they were not framed, according to, or with any Regard had to the Principle there laid down, *viz.* the Chance or Probability of the Life of an Annuitant, for there can be no Chance or Probability of that happening in Life, which is impossible ever to happen. I confess it exceeds my Comprehension, by what Means or on what Grounds this Author could be induced to suppose, even in the first Instant, and flatly in Contradiction to his own first and fundamental Position, that the Chance or Probability of a Life of one and the same Person could by any Ways or Means whatever

ANNUITIES for LIVES, &c. 49

ever be varied ; and yet his Tables here are founded upon a Supposition, that such Chance does vary as the Rate of Interest varies, for his first Table gives us on a Life of 30 Years Age the Chance or Probability of his living for 25 Years at 4 *per Cent.* Interest, and at 8 *per Cent.* for 16 Years only ; and the Instance following shows most plainly that this is intirely false.

From his Table in P. 22, &c. which shows how long an Annuitant must live to receive the Value of the Money he gave for his Annuity, we find that if he buys at 4 *per Cent.* Interest he must live 25 Years, and if he buys at 8 *per Cent.* Interest he must live 16 Years. Now if one and the same Person buys two Annuities for his own Life, and purchases one at the Rate of 4 *per Cent.* Interest, and the other at the Rate of 8 *per Cent.* then such Annuitant, in order to receive the Value of his Principal Money on one of the Annuities, must live 25 Years, and, with Regard to the other, he need to live only 16 Years : But 'tis in Nature impossible that his Life should continue for 25 Years, if it ends in 16 Years ; and almost a Contradiction in Terms, to say, that the same Annuitant has a Chance or Probability that he shall live 25 Years, and at the same Time a Chance or Probability that he shall live only 16 Years. Besides, these two Bargains can't possibly be fair and just ones on both Sides, for if the Annuitant has a Chance or Probability to live 25 Years, he has over-reachd the Vender who sold at 8 *per Cent.* because with Regard to

H

him

him the Annuitant will have been reimbursed the Principal, or received the Value, in 16 Years; and, on the other Side, if the Annuitant has a Chance to live only 16 Years, then with Regard to the Grantor at 4*l. per Cent.* the Annuitant himself will have been cheated, because there will be nine Years wanting to make up his Principal, or to receive the Value of the Money given on the Purchase. In short, if this Writer's fundamental Position, *viz.* that the Chance or Probability of the Continuance of a Life be the Measure of the Value of an Annuity for the Life, be a right one, as I make no Doubt it is; or indeed if he intended to make Use of such Chance as his Rule for constructing his Tables; instead of his long Rows of Numbers and Figures, which are extended for 50 Pages together and upwards, he might even as well have set out so many broken Reeds, for he that makes Use of one as his Guide, in the Valuation of Life Annuities, will be led into gross and very mischievous Errors, as surely as he will be deceived in his walking who leans on such rotten Staffs for his Support. This Writer, I think, somewhere in his Treatise, insinuates, that he grounded his Calculations and Rules on the Practices of som of the great Companies in *London*, or, *vice versa*, that they grounded their Practice on his Rule; but, whichever of the two were the Case, I believe most People at present will be ready to pronounce, that som Events have sufficiently damned both the Rules and the Practice.

I shall

I shall not need to add any Thing farther on this Subject, unless somewhat to inform the Reader on what Grounds I framed the Tables for the Value of an Annuity on a single Life, and in what Manner they were constructed; so that he may be able to judge for himself how far he may depend on them. I adhere then to the Position laid down in the *Essay*, that the Chance of the Duration of the Life is the only sure Measure of the Value of an Annuity depending on that Life; for no material Objection to it has occurred to me which has not been obviated or sufficiently removed. The Chance of Vitality being then the Ground-work, in order to investigate this, I reviewed the Bills of Mortality for *London*; and having an Opportunity of seeing and considering an Account of the Mortality of the Nominees in the Government Annuities on Survivorship, I had special Regard to such Account; since it contained a Bill of Mortality of Individuals without Variation, and therefore much the best Guide to discover and fix the Chance of Vitality.—

Now, since there is one certain Stage of Life which must have the greatest Chance of Vitality; for those Chances, from the Beginning of Life, do increase to a certain Time, and from thence decrease to the End of Life; my first Inquiry was what might be that Year or Years of Life wherein the Chance of Vitality was greatest.—To fix this Point, I consulted first the *London* Bills of Mortality, and those of the Nominees in the Government Annuities, and from these fixed the Age

between six and ten, including both, as the best Stage of Life, on the following Grounds. On a View of those *London Bills*, it appears that the Number of Persons dying between 10 and 20 Years Age, is 30 in a 1000; and in the Period between 5 and 10 Years age, tho' no more than Half the Length of the former Period, the Number is 38 in 1000; and in these two Periods the Proportion of Mortality is the lowest: But then, tho' the Proportion of Mortality in these two Periods is not the same, and in the Period of younger Life is much the greater, I considered that the Children of the Ages between five and ten were respectively and gradually removed farther from the Extremity of Life, and that the one might nearly counterbalance the other, I stated all those five Years at one and the same Chance of 35 Years. I then examin'd how the Case stood in the Account of the Mortality of the Nominees in the Government Annuities, and found it to stand thus: The Persons were nominated some time before *Midsummer* 1693; and at *Christmas* 1693, the Account I have seen being drawn up from *Christmas* to *Christmas*, the Number of Persons then surviving was 1009, and at *Christmas* 1728 there were dead 505; so that in 35 Years one Half exactly were dead; and I suppose that all the Persons nominated, and when nominated, at an Average, might be something between the Age of six and ten. To satisfy myself farther in this Point, I made a Computation on the Bills of Mortality for *London*, and observed the

the same Method prescribed by Dr. *Halley*, and made Use of by him and Mr. *Hodgson*, and another on the same Bills in a Method form'd by myself, and the Produce for the even Chance of Vitality for a Life of ten Years Age is, upon all the Operations, very nearly the same; and, in som of the Ages of Life younger than ten, this Chance runs rather higher.—

Having thus stated the Chances of Vitality for the best of Age of Life, *viz.* of six to ten, and suppos'd it to be equal to a Term of 35 Years; and since an Annuity for such Lives will be equal to the same Term; most People, I believe, will think the Estimate sufficiently high, even for that very best Age. From thence I proceeded to the Stages of Life precedent and subsequent to this, and propos'd to settle the Chances of these by inquiring into and fixing the Proportions of the Decreases of them from the said Term of 35 Years, for every single Year, or for every Period of ten Years, respectively. Here I was in Hopes of saving myself som Trouble, by using the Labors of som of my Predecessors who have wrote on this Subject, and particularly of Mr. *Hodgson*, who in his Treatise, P. 6, has given us a Computation of these Chances, from every Period of ten Years of Life, from ten Years Age to the Extremity of Life. For this Purpose, I threw such his Computation into a short Sketch, exhibited at the End, in Scheme No. 1. but, on doing this, I discovered immediately that such Scheme did not give us a right Partition of those

those 35 Years or Chances for all the several Periods of ten Years these mentiond. The Defect in it appears almost on the Face of the Scheme; but, in the Instance which follows, 'tis so gross, that it cannot fail of being seen, when pointed out, by every Man of common Understanding. That the Chance of Vitality on a Life for one Year does sink in that Proportion in which a certain Number of Persons living at the Beginning of such Year does die before the End of it, is a plain and an indubitable Truth: And yet the Decrease of these Chances given in the Scheme, in som Periods of ten Years, where we throw such single Years into a Period of ten Years, runs counter to that Position, directly, and to a very wide Degree. For Instance, in the Period from ten to twenty Years Age, the Chance of Vitality is sunk eight Years, and consequently in Proportion for each single Year of these ten Years, and in the succeeding Period, 'tis sunk only five Years and an Half; and yet the Persons dying in the first Period are only 31 out of 490 living at the Beginning of it, and in the second the Persons dying are 94 out of 459 living; from whence it appears that the Number of Persons dying in the second Period is much more than double the Number of those dying in the first; and yet the Chances of Vitality sunk in such second Period are not near three Quarters of those sunk in the first: Therefore the Partition in this Scheme, not giving the true Decreases of these Chances of Vitality for som Periods and Years of Life,

Life, cannot give us a just Partition of these Chances for the whole Life. From thence it will follow, that the Tables for the Value of Annuities for a Life, constructed by Mr. *Hodgson*, do not give us the true Value of them, even tho' they were in all other Instances faultless; for that the Value must depend on such Chances, and he himself supposes as much, and yet these Chances themselves, in some Parts of Life, are not rightly adjusted, by this Method; and this is the Case in all the Stages of Life from the 10th to the 60th Age of Life, or near it; and, believe me, this is a very large, and, in all Respects, a considerable Part of Life.—

I cannot forbear adding a few more Words on this Subject, because I think that, from this Writer's own Position, it may be demonstrated, that his Repartition of the Chances of Vitality, at least for a Life between 10 and 20, must be wide of the Mark. In his making the Computation of these Chances, I suppose that he made Use of his own Tables of Vitality for *London*, by computing in what Time the Number of Persons living of the Age of 10, of 20, and 30, were respectively reduced to an Half, and then taking such Time as the Term to which Persons of those respective Ages were equal; for that, on such Computation, and on such Operation, they do come out to be the same as we find them in his Treatise, viz. 35, 27, and $21\frac{1}{2}$. Now as the Decreases of the Chances between 10 and 20, and between 20 and 30, appear to be unproportionate,

tionate, the first being eight Years by the Death of only 31 Persons out of 490, and the second being no more than five and an Half by the Death of 94 out of 459; I was so much surprized, as to mistrust this Method so far, as to examin it more accurately than I had done when I wrote my *Essay*, for there I gave into and made Use of it; but, on a closer Examination and frequent Trial of it, I am satisfied that the Rule will not hold in all Instances, tho' in som it does. I lookd then into the Position on which this Writer grounds and makes the Calculation of the Chances which immediately there follows; and, on a Calculation made by the Method prescribed by that preliminary Position, it appears, that 'tis 14, and much above, to 1, that a Person of 10 Years old lives to the End of the succeeding Period of 10 Years; and that 'tis only 5, and a little above, to 1, that a Person of 20 Years lives to the End of the succeeding Period of ten Years: From whence it follows, that the Chances of Vitality for the Lives in the Period between 10 and 20 Years, is very far from being rightly apportiond; —for he who is 10 Years of Age, and has the Odds of 14 to 1 to live 10 Years, has evidently a greater Chance of living to be 20 Years old, than he that is 20 Years of Age, and has only the Odds of 5 to 1 to live 10 Years, has of living to be 30 Years old: And yet this Author's Computation of the Chances of Vitality of a Person of 10 Years, and a Person of 20 Years Age, makes these Chances of the Person of the younger Life

be greatly less than the same Chances on the older Life. This being the Case, on the Method made Use of by this Author for adjusting the Chances of Vitality, I consulted Dr. *Halley* on this Subject, but I find that he prescribes and makes Use of the same Method as this Author does; but I must beg Leave, in this as well as in som other Matters of this Kind, to dissent from them both, and to affirm that this Rule does not in all Instances, tho' it may do in som, give us the even Chances of Vitality, and that for the Reason and on the Computations just now made; and those are built upon the Foundations laid down by Dr. *Halley* himself, where he gives the Rule to find the Odds, which a Person of a given Age has to live for a given Term. Being forced thus to resort to a different Method, I found that which follows, both to ascertain the even Chance of Vitality for a Life, and for any Period of Years: And this differs very little from that given by the Dr. for calculating the Odds of Vitality for a certain Number of Years, in another Shape indeed, and with som Additions.

The Rule then is this: To take the Number of Persons living at the Beginning of any Year or Term of Years, and the Number living at the end of that Year or Term Years; and if we subtract the one from the other, the *Remanet* is the Number of Persons dying in that Year or Term of Years: Next, to take the Number of Years, which we may call Chances of Vitality, to which a Person of the Age named may live, if we compute to the Ex-

I tremity

tremity of Life : and then to investigate what is the Proportion in such Years or Chances of Vitality, which the Number of Persons living at the Beginning of such Year or Term of Years bears to the Number of those dead at the End of the Year or Term of Years. To perform this, we must multiply the Number dead in the Year or Term of Years by the Number of Years or Chances of Vitality through the whole possible Life, and divide the Produce by the Number living at the Beginning of the Year or Term of Years : And the Quotient will give us the Chances of Vitality sunk in that Year or Term of Years : And, if we deduct the Number of Chances sunk in that Time out of the Number of Chances subsisting at the Beginning, the *Remanet* will be the Number of Chances due and belonging to the Life proposed, and the Term to which such Life will have an even Chance of Duration.

Or thus : In Case the Number of Years or Chances of Vitality for any Age of Life be stated and known ; if we want to know what be the Number of Years or Chances of Vitality due and belonging to a Person of the next or any other subsequent Age of Life, we need only to take that Number of Years or Chances of Vitality, to which the Life of the Person of the Age next precedent to the Age of the Person after whose Chances of Vitality we are inquiring ; and then to investigate what is the Proportion in such Years or Chances of Vitality, which the Number of Persons living at the Beginning of such Year or Term

of

of Years bears to the Number of those dead at the End of the Year or Term of Years, and then to proceed as before directed.

I shoud observe here, whether we take a Number of Years or Chances, according to all the possible Years or Chances subsisting on the Life given, which in a whole Life may be supposed to be an 100, it being possible that a Person just born may live to be an 100 Years old; or whether we take such a Number of Years or Chances, as answers to the even Chance of Vitality on the Life of a Person of the Age next precedent to the Age of the Person of whom the Inquiry is made, where such even Chance is already stated and known, the Decrease of the Years or Chances in each Life or Term of Years must be and will be exactly in the same Proportion. So that either of those two Numbers may be used with equal Success.

As this Way of Reasoning and the Rule may seem a little abstruse, I will apply it in an Instance or two on the Persons named in the Government Annuities on Survivorship. The Nominees in these Annuities were named at or before *Midsummer* 1693, and at *Christmas* 1693, when my Account begins, the Number of them then living was 1009, and I did suppose that the Age of each Nominee, at an Average, might be about nine or ten. We want to know then to what Age any one of these Nominees might probably live, or what were the Chances of Vitality due and belonging to any one of them, supposing him

to be ten Years old, and as of such Age to have 90 Years or Chances of possible Life. The Number of Persons living at the Beginning of this Year, viz. at *Christmas* 1693, was 1009: At the End of the Year 1728, there were living 504, and, if we deduct 504 out of 1009, the Number remaining will be 505, that is, in that Compass of Time died 505. The Age to which any one of these Nominees might possibly live, being all supposed to be ten Years old, is 90. Then under the Direction of the Rule we multiply 505, the Number of the dead, by 90, which is the Number of Years or Chances through the whole possible, and the Produce is 45450: And if we divide this Produce by 1009, which is the Number of Persons living at the Beginning of the Term, the Quotient comes out to be 45, a small Matter over. From hence, we find that between *Christmas* 1693 and *Christmas* 1728, that is, in 35 Years or very near it, one Half of these 90 possible Chances were lost, and consequently the other Half left: Therefore the Life of one of these Nominees, on the even Chance, was equal to a Term of 35 Years, or might probably continue in Being for such a Term; and on this Computation, and some others before mentioned, I stated the even Chance of a Life of ten Years Age in general at 35 Years, as I found it to be in this Particular.

To give another Instance: We will compute the Chances of a Life, where we will suppose that those Chances of Vitality for a Life of ten Years
Age

ANNUITIES for LIVES, &c. 61

Age is fixed and known; and there will make Use of the second Part of the Direction of the Rule. The Number of Nominees in the Annuities on Survivorship living at *Christmas* 1693 was 1009: The Number dying between *Christmas* 1693 and *Christmas* 1703 was 117. The Age of each Nominee, at an Average, we have supposed to be ten Years or something near it: A Life of ten Years Age, on the even Chance, we have stated as equal to 35 Years: Now, if we multiply 117 by 35, the Produce will be 4095, and, if we divide that Number by a 1009, the Quotient will be 4, and a little over: So that the Decrease of the 35 Years or Chances of Vitality in those ten Years will be 4 Years and a small Matter over; and, if we deduct 4 out of 35, the Years or Chances of Vitality remaining will be 31, and this will be the Number of Years or Chances for a Life of 20 Years Age. If we proceed in like manner on a Life of 30 Years Age: The Number of Persons living at *Christmas* 1703, supposed then to be of the Age of 20 or near it, was 892: A Life of 20 Years Age, on the even Chances, has been computed and stated as equal to a Term of 31 Years: The Number of Persons dying between *Christmas* 1703 and *Christmas* 1713 was 169: And, on the like Operations as before, the Decrease of the Years or Chances in that Time will be 5 Years and $\frac{1}{8}$, or near six Years; and, if we deduct six Years out of 31, the Years or Chances then remaining will be 25, and

and will be the Number of Years or Chances for a Life of 30 Years Age.

By this Rule, and in this Manner I computed the Decrease of these 35 Years or Chances, by Periods of ten Years, from the Age of 10 to an 100; and made Use of the Bills of Mortality, in the Annuities on Survivorship from the 10th to the 68th Year of Life, which was as far as those Bills could conduct me, and from thence, being destitute of this sure Guide, for the four Periods of remaining Life, I made Use of the *London* Bills of Mortality, observing still my own Rule: And by these Decreases I constructed the Value of Annuities exhibited in the Table annexd. I have before computed, on the Bills of Mortality for *London*, the Decrease of these 35 Years or Chances of Vitality, for each Period of ten Years, from 10 to an 100 Years Age, from the Account given of them by Mr. *Hodgson*, and have set out the Proportions of them for each Period of ten Years in Scheme N. I. — Here I have made a Computation likewise, in my own Method, of the Decreases of the same Chances on the same Bills of Mortality, for the same Periods of Life, and the Proportions of them, as stated by me, stand as in Scheme N. II; and I believe it may be safely left to the Reader, on a near Inspection on those two Schemes to discern which is nearest a regular and proportionate Decrease, and deserves the Preference; especially if this Consideration be taken along with it, *viz.*
that

that this Writer does in express Terms say, that, *after Persons arrive at ten Years, the Decrements of Life are little in Comparison with the former Years, and decrease regularly.*

I assert then, on computing by my Rule, and on the *London Bills of Mortality*, that the Years or Chances of Vitality lost in the ten Years, between the Age of ten and twenty, are no more than $2\frac{7}{8}$, as stated in the Scheme, N. II; and that a Life of 20 Years Age is equal to $32\frac{7}{8}$. Nay, I may go farther, and assert, that the Case is exactly the same, both with Regard to the Years or Chances lost in that Time, and the Years or Chances remaining at the End of it, even where we use Dr. *Halley's*, or this Author's Rule for computing the Odds or Chances that a Person of ten Years Age does or does not live to the Age of 20 Years, and this too, whether we make such Computation by the whole Period of ten Years collectively, or by each Year singly and separately. Consequently, if a Person of ten Years Age has at that Time an even Chance to a Term of 35 Years, which is a Point admitted on all Hands, and in living ten Years loses no more than $2\frac{7}{8}$ of those Years, or Chances, the Years or Chances remaining must of Necessity be $32\frac{7}{8}$, and his Life at 20 Years Age be equal to that Term: And therefore the even Chance of Vitality for a Life of 20, computed by Dr. *Halley's* and this Author's Rule, and stated as equal to 27 Years only, is very far wide of the Mark.—

The

The Upside of the Matter is this ; that in stating these Chances by Dr. *Halley's*, or this Writer's Rule, which is the same, the Decrease of them, in most Instances, especially in the younger Part of Life, is the greatest when the Number of Persons dying is proportionably lowest, and the Decrease the least, when the Number dying is highest ; which is directly contrary to the Truth, for no Man, surely, can conceive that these Chances should sink 8 Years in the Period between 10 and 20, in which die only 31, out of 490, that is, at an Average, three only in each Year, and one over in the Whole ; and yet, that they should sink no more than three Years in the Period between 40 and 50, in which there die 90 out of 294, that is, at an Average nine in each Year ; and at the same Time admit, and it must be admitted, that the Number of Persons dying is the Measure of such Decrease.

In constructing the Tables for these Chances of Vitality, and the Value of Annuities on a single Life depending thereon, I made Use both of the Government Annuities, and *London Bills of Mortality*, as beforementioned but by the Method laid down by myself ; and chose here to compute those Chances by Periods of ten Years first, and then divide each Period into single Years at an Average, rather than to compute them by single Years, in Regard that in some one Year or other the Number of Persons dying in that Year might much exceed or fall short of the Number dying in the precedent or subsequent Year, merely by

by Accident, from the greater or less Salubrity of the Air in one Year than another, and this appears to be frequently the Case in the Nominees in the Government Annuities: As for the Chances of the intermediate Years within each Period, I interpolated them by an Equation, as near as could be done, by keeping within the Compass of an eighth Part of a Year, and that there I suppose is as near the Mark as is necessary in these Matters, or can well be put in Practice. To this I have added, and inserted in Table N. IX. a Scheme of the Chances of Vitality for the City of *London*, constructed, according to my own Method, from the Bills of Mortality there; and, on comparing it with the Chances in the general Tables, the Difference does not seem so great, but that in Practice, in most Cases, a Man may safely enough make Use of either of them as he likes best: And, tho' I have not here added the Value of an Annuity on any of these Chances of Life for *London*, yet that Defect is easily supplied by one or other of the precedent Tables.—

The Value of Annuities on a Life given in the general Tables, and that which will arise on a Computation made by Table, N. IX, will at first View and to some Persons seem very high; but, for my own Part, I am fully persuaded, and others, perhaps, when they have well considered what has been here offered to prove it, may be induced to think so too; especially if they admit that the Chances or Probabilities of the Duration of Life are in the Tables rightly estimated. Where

a great Number of Annuities is granted to Variety of Persons on their Lives, a Variety of Chances must in the Event necessarily come out, and I believe it will be found ; that the Estimate here made, at an Average, is a fair and reasonable one, on the Whole : And on single Grants to single Persons there's no Way to form a Judgment of the Value of them, but by accumulating a great many Grants together, and taking a Medium. And in this my Opinion, that I have not overvalued these Annuities for a Life, I am very much confirmed by a late and recent Instance, and which will not soon be forgot by som People, since they have terribly sufferd by not well considering or ill calculating the Value of such sort of Estates ; and will be a Caution, at least, to Persons to be on their Guard in Transactions of this Nature : *Felix quem faciunt aliena Pericula cautum.*

ADDENDA.

A D D E N D A.

AFTER writing the preceding Discourse, and indeed since it was prepared and ready for the Press, was put into my Hands Mr. *De Moivre's* Treatise on this Subject, the third Edition; and having no convenient Opportunity of inserting my Observations upon it in the Body of my Book, and as his Character challenges a special Attention, I hope I shall be excused, if I give my Thoughts upon it in this Place; and they are, in short, that the Rule which he proposes for investigating the Value of Annuities for a single Life is a wrong one, and all the Tables which he has constructed by that Rule, in every Instance, erroneous. My great Objection to this Rule, which I think quite unnecessary to be inserted here, is the same as I made to Dr. *Halley's* Rule, and is this; *viz.* that in Fact it does, and necessarily must, produce such a Sum as the Value of an Annuity for one and the same individual Life, as that, on the Variation of Interest, the Term to which such Value corresponds shall be a different one.

Now the Defect in the Doctor's Rule which produces these absurd Values arises from hence, that it directs, that out of the Value of an An-

nuity certain for a Year, in each Year of Life and through the whole Life, we are to deduct a Value corresponding to the Chance of Mortality arising in each Year respectively, or, which is much the same Thing, a Value in Proportion to the Degree of Probability that the Life may determine within the Year. Mr. *De Moivre*, in the first Edition of his Treatise on this Subject, P. 5, &c. gives the same Direction in Substance, tho' in Expression something variant; and in Pursuance and under this Direction, P. 11, &c. he computes the Value of an Annuity for the Life of a Person aged 50, and at an Interest of 5l. per Cent. and concludes that 'tis in Value 10-15. In this his third Edition, which he calls a more full one, he has thought fit to leave out the Whole of this Direction, and enters immediately upon the Solution of that Problem, viz. what may be the Value of an Annuity for the Life of a Person aged 50, and, after a Calculation in the same Method as in his first Edition, concludes that 'tis in Value 10-35. But 'tis impossible that 10-15 and 10-35 should both be the Value of this Annuity; and it happens very unluckily that neither of them are right, for the exact Value is 10-34. But to let this pass, for 'tis not material which of the three, or whether any of them, be the real Value; but it may be a proper Question, what might be the Reason of omitting, in this his fuller Edition, the Whole of this Direction. Some People, perhaps, will solve this Problem by saying, that, since his first Edition, he had discovered

covered that this Direction produced the preposterous Values of Annuities before-mentioned; but that, to be sure, must be an idle Surmise, because, even in this more correct Edition, and in his Tables inserted in it, he has pursued this very same Direction. Others will suggest, that on finding this Objection made to his Rule, and this Direction, in particular, to which they are confident he was no Stranger; and that it was too clear and strong for him to grapple with, and most certainly it has never been answerd, and probably never will be; he thought it the best Course to remove it out of Sight, as much and as far as he could.

But be that as it will; since I have already, in my *Essay*, treated of this Matter, viz. of the absurd Values produced by the Rule, and have farther reinforced my Objections to it in the preceding Treatise; I shall here content myself with asserting, which indeed is very little more than repeating, that 'tis in Nature impossible that one and the same Life can have one and the same Chance or Probability of Duration for different Terms of Years; for Instance, for 25, 26, or 28 Years, as the Rate of Interest, at which the Value of the Annuity is computed, is or may be varied; or indeed on any other Account, or by any other Means whatsoever. I need therefore only to show that the Rule does in Fact produce such Values; and that is seen by a mere Inspection into the Tables constructed by the Author himself, by the Rule, and there they stand thus.

The

The Annuity for the Life of a Person of 10 Years Age, at 4*l. per Cent.* is in Value 16-88, which is equal to a Term of $28\frac{2}{3}$ —of the same Age, at 5*l. per Cent.* is 14-60, which is equal to a Term of $26\frac{2}{3}$ —and of the same Age, at 6*l. per Cent.* is 12-84, which is equal to a Term of $25\frac{1}{4}$. Now I say, and I believe most of Mankind will concur with me, if a Person of 10 Years Age has a Chance or Probability to live only 25 Years and $\frac{1}{4}$, that 'tis not possible he should have the same Chance or Probability to live to the Age of $26\frac{1}{4}$, or of $28\frac{2}{3}$.

If we carry this Matter a Step farther, and compute by this Author's Rule what is the Value and Term corresponding on a like Life, at 3*l. per Cent.* we shall find it to be 19-87, which is equal to a Term of $30\frac{1}{4}$; and 'tis Matter of some Wonderment that this Author, in this his Edition of the Year 1750, has not inserted in his Tables the Value of Annuities for a Life at that Rate of Interest. Since the Government has reduced the Interest on public Securities, which in Stock and Annuities amount to more than fifty Millions, from 4 to $3\frac{1}{2}$ for seven Years, and from thence to 3; and as the Prospect that the common Price of Money will be at that Rate seems to be no very distant one; I suppose, if private Persons, public Companies, or the Government, were disposed to grant Annuities for Life to any Number of Persons, that they would hardly think it prudent to charge their Estates or Income with an Interest exceeding 3*l. per Cent.* especially on Securities

Securities not redeemable. On this Account I should have thought that such a Table, now at least, would have been very proper, and so I have practised myself; but this Author, perhaps, might be apprehensive that such a Table would have exposed the Error of his Rule too nakedly; for in Truth the Difference between the Term on a Life of 10 Years Age at an Interest of 3*l.* and the Term on the same Life Interest at 6*l.* is five Years and an Half: However, the Tables which he has exhibited have done it sufficiently.

To the Evidence from his Tables we must add, that the Author himself in the Body of the Book, in this last Edition, has inserted something which puts this Matter beyond all Doubt: And, since he has been so good as to have brought in so strong a Reinforcement to support my main Objection, I should be uncivil, if I did not acknowledge and take Notice of his Supply. Let us read them. In *p.* the 22*d.* he gives us this Problem. *Supposing three equal Lives of any given Age, for Instance 30, and that, upon the Failing of any one of them, that Life shall be immediately replaced (which by the Way has something of the impossible in it) and I then receive a Sum I agreed upon, and that to Perpetuity for me and my Heirs: What is the present Value of that Expectation, and at what Intervals of Time, one with another, may I expect to receive that Sum.*—I have set forth the Problem at large, because the subsequent Remark which he makes, on which I lay my Finger, becomes thereby more plain

plain and intelligible.— The first Question is, *viz.* what is the Value of such Expectancy, after having supposed that the Sum to be paid on these Contingencies was an 100 *l.* he resolves that the present Value is—162 *l.*—Now I very much doubt the Justice of this Solution; for the Sum produced differs considerably from the Sum produced by the Method which I use to compute the Value of such Expectancies, and I may be confident that my Method is a right one, because 'tis founded on the Reason of the Thing, and might be confirm'd by Demonstration, and on a Computation in my Manner, if we supposed these Installments to incur once in ten Years for ever, and he supposes them to incur in $9\frac{1}{4}$, the Value of this Expectancy comes out to be 181-16-3-1, and near a Farthing more.

But let the true Value of it be what it will: We will now read his Remark on the second Question, *viz.* at what Intervals of Time, one with another, he might expect to receive that Sum: And after solving that Question, in *p.* the 28th, he adds—Remark—*It is not to be expected, if the Interest of Money was higher than 5 per Cent. which was the Interest made made Use of in the preceding Calculations, the Intervals of Time, after which the Renewals are made, would be the same as now; for it will be found, that, as Interest is higher, the Intervals will be shorter, and, as it is lower, the Intervals will be longer: Yet one might make it an Objection to our Rules, that the Length of Life would thereby seem to depend upon the Rate*
of

of Interest. The Author admits then, that 'tis an Objection to his Rules, if they do in Fact make the Length of Life to depend on the Rate of Interest; and, whether he admits it or not, most certainly it is such—The sole Question then will be whether a Variation of the Rate of Interest in this Case does not likewise cause a Variation in the Length of the Lives, as it does in the Length of the Intervals. He lays it down, that the Intervals of Renewal, or the Space of Time between one Renewal and another, will and must vary as the Interest of Money varies, on the one Side or the other. From thence I argue thus: If the Intervals of Renewal are made shorter or longer (as the Case may happen to be) by a Variation of the Rate of Interest, then the Duration of the Lives, on which the Intervals depend, must be shorter or longer in the like Proportion, because the Duration of the Lives is made, and by this Author himself is taken for, the Measure of these Intervals. Or take the Reasoning thus: The Rate of Interest governs the Intervals, the greater or shorter Length of the Lives constitutes, or rather is one and the same Thing as, those Intervals: The Rate of Interest therefore governs the Length of the Lives. This Way of Reasoning is sure enough right and conclusive; but it may be further added, that this Writer's Tables, drawn by himself, and by his own Rule, in the Instances beforementioned, do demonstrate that, in the Case of Annuities for a single Life, the Rate of Interest governs the Length of Life,

L

for,

for, as one is varied, the Length of the other is varied with it and by it.

However, since this Writer offers at something which he calls an Answer to this Difficulty, let us read; and I choose to give it in his own Words, because it has something of the extraordinary in it, viz. a Desire to seem to say something, a Study to involve that seeming something in obscure and perplexed Language, and a Care at the same Time to say nothing to the Purpose; which last may indeed very easily be done in a Matter to which nothing can be said to the Purpose. The Words are these. *It must be observed, that the calculating Time imports no more, than that (considering the Circumstances of the Purchaser and Proprietor of the Lives, in Respect to the Rate of Interest agreed upon, and the Sum to be given upon the Renewal of a Life or Lives) the Proprietor makes the same Advantage of his Money, as if he had agreed with the Purchaser, that he should pay him a certain Sum of Money at equal Intervals of Time, for redeeming the Risque, which he the Purchaser (read rather the Proprietor) runs of paying that Sum when the Life or Lives drop; but the real Intervals of Time will be shown afterwards.* Part of this Sentence I have included in a Parenthesis, so that those Words being omitted in the reading, as they may very well be, it may more easily be understood; and for the Word *Purchaser* we must read *Proprietor*: And then the Substance of his Answer will be, that the Proprietor of the perpetual Lease, as I would call it, will make the same
 Advan-

Advantage of his Money, if he continues to make his Payments on the Contingency of Lives dropping, as if he made an Agreement to pay the same Sum of Money at the End of a determinate Number of Years, equal to the computed Intervals. But is not the Calculation of the Time a just one, and the very same, whatever was the Import or Views in making it? Do not the Words at the Close of the Sentence, that the real Intervals of Time shall be shown afterwards, strongly intimate, and suppose that there is a real Difference in those Intervals, where there is an Alteration in the Interest, otherwise no Occasion to show them, nor could any be shown? Does not the Author himself assert as much, and is not the Fact notoriously true? And is it not evident, that these Intervals are created by, or are one and the same Thing as, the Duration of the Lives, and this Author himself measures and demonstrates the Length of the one by the Length of the other? To these Questions if the Answer be in the Affirmative, and in the Affirmative the Answer must be; it will follow, as clearly and certainly as any Demonstration in this Writer's Book, that the Length of the Lives as well as of the Intervals is by his Rule made to vary and depend upon the Rate of Interest: And thus by one Breath of his Mouth has he blown in Pieces all his fine Piece of Machinery.—

If we carry our Inquiry farther and examine what Effect his Rule has on the Value of Annuities for joint and surviving Lives, and whe-

ther it does not there likewise make the Duration of Lives depend on the Rate of Interest, we shall find the Case to be the very same: And indeed 'tis impossible but that it should have the same Influence there as in Annuities for a single Life, for the Values of Annuities for two or more Lives, either joint or surviving, are all of them, by an ill-concerted Jumble of Values, form'd from the Values of Annuities for a single Life. If this Author had been so good as to have given us Tables of the Values of Annuities for these Lives, as he has done of those for a single Life, I doubt not but he would have enabled us to have shown in like Manner, that is, out of his own Mouth, that his Values of Annuities for these Lives likewise had the very same Fault: But, since we are deprived of an Opportunity of doing it in that Way, I will try what may be done without that Assistance.

In *p.* the 54th, third Edition, he gives us this Problem, *viz.* to find the Expectation of two Joint Lives, that is, the Time which two Lives may expect to continue together in Being; and then having taken two Lives of the same Age with those given in the Solution of his second Problem, *viz.* one of 40 and the other of 50, he solves the Question, and says, that 13-31 is the Number of Years due to the two Joint Lives. Now if the Expectation or Probability be, that one or other of these two Lives will have a Being for that Term, I humbly apprehend that the Annuity too will subsist for that Term, and at 5 *l.* per Cent. be of the Value

ANNUITIES for LIVES, &c. 77

Value 9-54. No, by no Means says a Learned Advocate of Mr. *De Moivre*; for he has demonstrated, in his Solution of the second Problem, and the Demonstration which follows, that the Sum 7-62 is the true Value of the Annuity for these two Joint Lives. The Matter under Consideration here is, whether the Rate of Interest does not govern this Value, and this Value govern the Duration of the two Lives, and not whether the Value be the right one or there be a Demonstration of it, tho' if there were Room for it here, and it were pertinent to the present Purpose, I could show there was none; let us see to what Term of Years this Value corresponds. If we look into this Author's third Table, which is constructed for the Value of Terms for Years at 5*l. per Cent.* and that is the Interest which is made Use of in computing the Value of the Annuity for these two Joint Lives; we find 7-72 to be the Value of an Annuity certain for a Term of ten Years; so that this Annuity is not equal to a Term of ten Years, but must determine before that Time, tho' both the two Lives will subsist and continue for thirteen Years and above.—

As I do not design, here, to deprive this Gentleman and his learned Friend of the Pleasure of their Conceit (and I can call it by no other Name) that there is Demonstration of this Value, I will admit it to be so for the present, on a Proviso nevertheless and Condition that they return me the like Civility, and admit that there is Demonstration

tion likewise of the 18th Problem beforementioned, and then we shall have Demonstration fighting against Demonstration; for one says that the Annuity is in Value 7.62, and the other says that it is 9.54, as before computed. Now, if it may be demonstrated, nay, whether demonstrated or not, if it be a reasonable Expectation or Probability, that one or other of these two Lives will subsist for thirteen Years and above, I very much doubt, whether the Learning of Mr. *De Moivre* and his Friends, both put together, will ever convince any Man, unless it be a very special Friend or so, that 'tis probable that this Annuity, which determines, when one of the two Lives fails, and not before, will determin in ten Years Time or less, and at the same be equally probable, that both the Lives will continue in Being thirteen Years and above. *Credat Judæus appella non ego.*

To apply this. Let then the Value of this Annuity be 7.62, or any other, except 9.54, which is the Value when computed on the Probability of the Duration of the Lives; since the Rate of Interest creates this Value, and this Value determines the Duration of these Lives, if that same Rate of Interest does not govern the Length of the Lives, I should be glad to be informd what does, since 'tis evident that the Expectation or Probability of the Lives does not; for then the Value would be 9.54, as before computed. But that which will put the Matter beyond all Dispute will be to vary the Rate of Interest, and to calculate the Value of Annuities on two Joint Lives at the several

ANNUITIES for LIVES, &c. 79

several Rates of 4, 5, and 6 per Cent, and then examining to what Terms those Values do respectively correspond—On an Annuity for two Joint Lives, each of 45 Years, the Values, and the Terms to which they respectively correspond, as I compute them, stand thus—

At 4 per Cent. Value 8-21, equal to a Term of $10\frac{1}{8}$

At 5 per Cent. Value 7-42, equal to a Term of $9\frac{1}{2}$

At 6 per Cent. Value 6-76, equal to a Term of $8\frac{1}{2}$

In Mr. *De Moivre's* Way of computing these Values, they differ a little, and may stand thus—

At 4 per Cent. Value 8-34, equal to a Term of $10\frac{3}{4}$

At 5 per Cent. Value 7-72, equal to a Term of 10

At 6 per Cent. Value 7-06, equal to a Term of $9\frac{1}{2}$

Now let us take which of the two Valuations we please, 'tis plain and obvious that the Difference in the Rate of Interest produces such a Difference in the Value as creates a Difference in the Term to which the Lives are equal, and this is no other than governing the Length of the Duration of the Lives. It will be said, perhaps, that my Valuation is a wrong one, but, if it should be so, yet the Valuation made in Mr. *De Moivre's* Method justifies the Conclusion; and, if Mr. *De Moivre* has demonstrated that these are the true Values of this Annuity at these three several Rates of Interest, he has then demonstrated the Point in Question, viz. that by his Rule the Length of the Lives is made to depend on the Rate of Interest— I say, however, that my Valuation, where 'tis made

made by a Computation on the Values, is a right one, as founded on the Reason of the Thing, and confirm'd by this Author's Solution of his 18th Problem, where he says, that on two Lives of equal Age, the Probability is $\frac{2}{3}$ of the Complement of any one of the two Lives. Now the Method by which I attain'd the Values before given by me is a very easy and a very obvious one, *viz.* by taking two thirds of the Value of one of the Lives singly taken, or, which is the same Thing, by taking one third of the Values of both put together. On this Account and in this View, som People will be apt to surmise that Mr. *De Moivre* had the same Thing in his View, *viz.* to take two thirds of the Value of one Life, or one third of the Value of both put together, because 'tis consonant to his Reasoning on this 18th Problem; but that he has enveloped the Matter in such Clouds of Multiplications, Subtractions, Divisions, and of Things not subject to the same Rules of increasing or decreasing, that he has made a shift to miss his own Mark: And this most certainly he has done, unless he disclaims his own Problem.

But som will say that on Mr. *De Moivre's* Side there is Demonstration of the Value, but I say there is no such Thing. His Solution of his second Problem, which produces this Value 7-72, contains no more than this. The Value of an Annuity for two Lives singly taken, being given; then follows a Multiplication of these two Values together, then a Multiplication of this Product by the supposed Rate of Interest, afterwards a
Subtraction

Subtraction, and lastly a Division; and the Quotient is said to be the Value of the Annuity. Now this Process does indeed demonstrate that the last remaining Quantity is 7-72: But does no more prove that 'tis the Value of an Annuity for these two Joint Lives, than it does, that 'tis the Value of a Mare or a Mule. The Thing which ought to be proved is, that this Process on the given Suppositions will produce such a Sum as is the Value of the Annuity, and not merely what is the Sum which the Process will produce, and the Process carries us no farther. Ay, but then follows a Demonstration; very true, but that still is no more than this, that Letters and Lines are substituted in the room of Numbers or Figures, and upon an Operation on them that the Value produced on such Operation is one and the same, as that produced by the Process, and it would be very strange if it were otherwise; but no Proof yet that this Value is the Value of the Annuity, or that the Process in one or the Operation in the other does produce such a Value. But that's not all: For there is, or seems to be, a Defect running both through the Solution and Demonstration, which must necessarily make them produce a Sum not exactly the true Value. It may indeed produce a Sum which shall come something near the Truth, and he must be a very bungling Operator who could not contrive Matters, so as not to be wide of the Mark; but 'tis a Rule in Mathematics, I think, that if a Man does not hit the Bird in the Eye, as the common saying is,

M

he

he is as much in the wrong, as if he were hundred Miles off.

The Defect I meant is this. In computing and fixing the Value of these two Annuities, when singly taken, he lays it down that the Decrements of Life, or of the Probabilities of the Duration of Life, are in Arithmetic Progression: and then proceeds to multiply these two Values thus fixd, and then multiplies the Product by the given Rate of Interest, *viz.* by 5. The Years or Chances of Life he calls the Complement of Life, and on the whole possible Life states them at 86, asserting that Life cannot reasonably be extended beyond 86; and then, these two Lives being each of the Age of 45, the Complement or Chances of Life resting on each of them will be 41: And then says, that these 41 Chances will decrease in Arithmetic Progression, as the Life proceeds in Age. I will admit that the Chances of Life do decrease in that Proportion, under the same Limitations as he puts upon them; *viz.* that it holds for small Portions of Life, and when the Years are near one to another, but not absolutely for the whole Life, when taken intire. But then, as to the fixd Values of the Annuities on these two Lives, which are each stated at 11-14, there can be no Pretence that they likewise decrease in the like Arithmetic Progression; for, if they did, then at the End of 20 Years and an Half, for Instance, when the Complement or Chances of Life are reduced to Half, then the Value of the Annuity for the Life should be reduced to Half in like Manner; but this

this is notoriously untrue and visible by a meer Inspection into his Tables of these Values, and comparing them, by which it appears that one is 11-14, and the other 7-05; and the Truth of the Case is, that the Decrease in the Values is in geometric Progression. And then as to the Number 5, the supposed Rate of Interest, in that there's no Decrease at all, it being invariably the same through the whole possible Life; what shall we do with this? Why truly I was thinking, since we are upon the decreasing Pin, that the Show, perhaps, would have a more ostentatious Appearance, if, instead of 5, we should take 4-9524, which is the present Value of 5*l.* to be paid at the End of the Year; and we know Interest is not payable till the End of each Year, and in Fact is seldom paid so soon, nor do the Probabilities of Life decrease in their arithmetic Progression, nor the Values in their geometric Proportion, till the End of the Year; and therefore I hold it advisable, in the next Edition, by all Means to make them sink, one and all, and all at one Time. If then we substitute 4-9524 in the Place of 5, there will be an Opportunity of adding some new Numerical and Mathematical Decorations; and besides upon my Word, *aut video, aut vidisse puto*, I see, or think I have seen, and I must not say more, because I have not computed it, nor design ever to compute it, that the Sum forth coming will be nearer the Mark, *viz.* 7-42, for that most certainly is the Value when the Computation is made by Values, as is done by him in this Case.

Now to blend and mix together, as it were in Hotchpot, two Things which decrease in one Proportion with two other Things which decrease in another Proportion, and then to throw in a third Thing, which has no Decrease at all; and from such heterogenous Ingredients to hope that we may extract the Value of a third Thing, is surely an idle and vain Imagination. But if Mr. *De Moivre* thinks otherwise, and will adhere to his Demonstration, he may, for me, and, for the present at least, continue in the peaceable Enjoyment of his beloved Mathematical Proofs, and I will content myself with the humble Productions of plain common Sense and Reason. I have said at present, because the Question here is not so much, whether 7-72 or 7-42 be the true Value of the Annuity for these two Joint Lives, and for my own Part I am satisfied that neither of them be so, as whether on a Variation of the Rate of Interest, in this Method of computing their Values, there be not such Values produced as make a Variance likewise in the Term to which the Lives correspond, and in the Length of the Lives. And, since that Point is evident, I shall not pursue the other any farther here, because it tends rather to show that this Author's Method of investigating the Value of Annuities for Joint Lives is erroneous, and the preceding Discourse treats only of the Value of Annuities for a single Life: And one Time or other, if Health and Leisure will give me Leave, tho' at my Age of Life neither of them are much

to be expected, I may possibly resume the Discussion of the second Matter.

I must say a few Words on the Subject of Annuities for two or more Lives and the Survivor, and I need to say very few, because the Point here is clear, that the Length of the Lives is by the Rule made to depend on the Rate of Interest. On computing, by the Rule, the Value of an Annuity for three Lives and the Survivor, all of the Age of 12, and at different Rates of Interest, the Values, and the Term to which such Values correspond, stand thus—

At 4 per Cent. Value 23-01, equal to a Term of 65

At 5 per Cent. Value 19-05, equal to a Term of 63

At 6 per Cent. Value 16-19, equal to a Term of 61

At 7 per Cent. Value 13-92, equal to a Term of 58-2

At 8 per Cent. Value 12-29, equal to a Term of 56

I do not affirm that these Values, all of them; are exactly true; however, they are near enough the Truth to answer the Purpose for which they are here inserted, *viz.* to show that, whenever we vary the Rate of Interest, we find a Variance likewise in the Term to which the Lives are equal; that is, that the Rate of Interest governs and determines the Length of the Lives; and it appears here that, between the highest and lowest Interest, the Difference in the Term is nine Years. This wants no farther Comment, so I shall add only a short Observation, tho', short as it is, it trenches deep into the Scheme, and all the Rules which Mr. De Moivre has contrived for investigating the
Value

Value of Annuities for one or more Lives, of any Kind, or in any Shape ; and my Remark is this. On computing, by his Scheme and his Rules, the Value of Annuities for a single Life, and for two or more Joint Lives, the Values come out to be such as correspond to a Term below the even Chance, or Probability of the Duration of the Life or Lives : And on the contrary, on computing the Value of Annuities for two or more Lives and the Survivor, the Values are always such as correspond to a Term above the even Chance, or Probability of the Duration of the Lives, or the Survivor of them. And I will say here, as I said in my *Essay*, on much the like Occurrence, that this is a Contradiction to common Sense and Reason, and leave it to Mr. *De Moivre* to reconcile it if he can ; but I bar all Proofs from Mathematical Schemes, unless he take special Care that his Data and Postulate are all right and clear.
